These data sets have been restored. There was originally one 9-track, 1600 BPI tape written in Binary. There is one restored tape. The DR tape is a 3480 cartridge and the DS tape is 9-track, 6250 BPI. The original tape was created on an IBM 3081 computer and the restored tape was created on an IBM 9021 computer. The DR and DS numbers along with the corresponding D number are as follows:

DR#	DS#	D#	FILES	TIME SPAN	
DR006134	DS006134	D063225	1	08/20/77 - 08/23/81	(VOYAGER 2)
			2	09/01/81 - 12/31/84	(VOYAGER 2)
			3	09/05/77 - 08/23/81	(VOYAGER 1) (a)

(a) D063225: Read error occurred in record 2798 of file 1.

INTERPLANETARY MAGNETIC FIELD DATA

VOYAGER 1 (77-084A-05F)
VOYAGER 2 (77-076A-05F)

This data set contains 1 9-track, 1600 BPI, binary tape created on the Modcomp. D-63225 has 3 files and contains data from both Voyager 1 (file 3) and Voyager 2 (files 1 & 2). The D and C numbers and time spans follow:

D#	C#	FILES	TIME SPAN
D-63225	C-24059	1	08/20/77 - 08/23/81 (VOYAGER 2)
		2	09/01/81 - 12/31/84 (VOYAGER 2)
		3	09/05/77 - 08/23/81 (VOYAGER 1)

Voyager Magnetic Field

Hour Averages

DCB = (RECFM=FB, LREC=32, BLKSIZE=6400, DEN=3)

The tape is unlabeled, 9-track with 1 file, created in binary on the IBM 3081.

WORD	TYPE	MEANING	UNITS/COMMENTS
1	I*4	S/C ID	= 1: Voyager 1 = 2: Voyager 2
2	I*4	Year	77, 78, 79
3	I*4	Day	Jan. 1=1
4	I*4	Hour	(0,1,... 23)
5	R*4	F1	Avg. |B|, (nT)
6	R*4	F2	$(\bar{B}_x^2 + \bar{B}_y^2 + \bar{B}_z^2)^{1/2}$ (nT)
7	R*4	Lat. Angle *	Deg (HG coordinates)
8	R*4	Long. Angle *	Deg. (HG coordinates)

The uncertainty in each component of an hour average of B is in the range from 0.01nT to 0.1nT. The most probable uncertainty is approximately 0.04nT per component for hour averages of B. The uncertainty in long-term averages is appreciably smaller.

* These are computed from Hourly Averaged Cartesian Components of the Magnetic Field

NEPTUNE ENCOUNTER (HG COOR) TAPE

THIS DATA SET CONSISTS OF THREE MAJOR SUBSETS: "PRE-NEPTUNE", "NEPTUNE", AND "POST-NEPTUNE". THE PRE-NEPTUNE TAPE IS 3480 CARTRIDGE AND WAS CREATED ON AN IBM COMPUTER. THE DD AND THE DC NUMBER AND ITS TIMESPAN IS AS FOLLOWS:

DD#	DC#	FILES	TIMESPAN

Notes on the Voyager 2 Magnetometer Data Set around Neptune Encounter -- R. P. Lepping, NASA/GSFC -- (3/12/92)

This data set consists of three (3) major subsets: "pre-Neptune", "Neptune", and "post-Neptune". The intervals covered by these subsets are the following: pre-Neptune covers Days 234, 235, and 236 of 1989 (where Day 1 is Jan. 1), Neptune covers 1800:00 UT of Day 236 to 0819:48 UT of day 238, but post-Neptune interval has not yet been strictly determined, but will probably start near 0600 UT of Day 238. Hence, there will be some overlap among these subsets. The first and third are rendered in standard conjoint-summary tape format, but the Neptune subset has a different format, developed for the special purpose of planetary field modeling, and described in the attached notes by J.E.P. Connerney; these notes also provide some information about the onboard magnetometer instruments. The first and third subsets, in the summary tape formats, provide 1.92, 9.6 and 48 s averages of the ambient field in Heliographic (R,T,N) coordinates, and where possible spacecraft (S/C) field data.

Because of intermittent electronic interference onboard the spacecraft which led to seriously contaminated outboard magnetometer data [of the dual magnetometer (mag) system], the standard dual-mag system data processing was not possible for those periods. Fortunately, the inner magnetometer data did not possess this contamination, but did suffer a low amplitude magnetic signal originating at the S/C -- and therefore measured by both mags. This interference could not be directly eliminated, because of the unusability of the outer magnetometer data in the usual S/C field elimination scheme, which subtracts from the net field the main (dipole) component of the spacecraft field. Where possible, the dual magnetometer processing scheme is employed and the S/C field is eliminate to a good approximation. However, a large percentage of the overall set is processed in the inner-mag-only mode, including those portions of the "Neptune" set which used the low-field inboard mag data stream. In this mode it cannot be strictly guaranteed that the S/C field did not also possess a slight background drift acting like an instrument zero-level drift. The table below, which applies to the pre- and post-Neptune subsets, shows the start/end times of individual segments, alternating between inner-mag-only mode and dual mag mode, as was necessary. The 'zero level' calibrations were matched at the boundaries of these modes with an attempt to be consistent throughout with an estimated absolute accuracy of the ambient field. The magnetic interference signal has a primary component of an oscillatory nature with a period near 4.5 minutes. Each of the three components of the ambient field for the pre-Neptune set are estimated to be accurate to about ± 0.04 nT in the dual mag mode and close to this when in the inner mag mode, especially when averaged over 4.5 minutes.

The post-Neptune data subset will follow with its descriptive notes.

41-50 SPARE

Matrices are left multiplying with elements in the order:

$$\begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix}$$

Time tag TN is relative words 1-2 above. Time tag DT is record header time plus 1/2 the length of the data record. When MAG(28) switch is on and the record is LFM, the time tag for relative words 32-40 above is record header time plus 47.04 seconds.

Coordinates: HG= (BR,BT,BN); S3 or L1 Spherical= (Br,Btheta,Bphi); S3 or L1 Cartesian= (Bx,By,Bz).
