HIGH & LOW SPEED MERGED DATA

71-109A-01A, 02A, 03A & 04A

4
1 of 4 bks.
~~# tapes~~

Table of Contents

---

1. INTRODUCTION:

The documentation for this data set was originally on paper, kept in NSSDC's Data Set Catalogs (DSCs). The paper documentation in the Data Set Catalogs have been made into digital images, and then collected into a single PDF file for each Data Set Catalog. The inventory information in these DSCs is current as of July 1, 2004. This inventory information is now no longer maintained in the DSCs, but is now managed in the inventory part of the NSSDC information system. The information existing in the DSCs is now not needed for locating the data files, but we did not remove that inventory information.

The offline tape datasets have now been migrated from the original magnetic tape to Archival Information Packages (AIP's).

A prior restoration may have been done on data sets, if a requestor of this data set has questions; they should send an inquiry to the request office to see if additional information exists.

2. ERRATA/CHANGE LOG:

NOTE: Changes are made in a text box, and will show up that way when displayed on screen with a PDF reader.

When printing, special settings may be required to make the text box appear on the printed output.

THESE DATA SETS HAVE BEEN RESTORED. ORIGINALLY THERE WERE 475 TAPES, 50 OF THESE TAPES ARE LOW SPEED AND 425 ARE HIGH SPEED MERGED DATA. FIVE OF THESE TAPES WERE COMPLETELY BAD, MANY OF THE OTHERS HAD MANY READ ERRORS, REFER TO THE SUMMARY SHEET FOR THE ERRORS AND WHERE THEY OCCURRED. THERE ARE 25 RESTORED TAPES. THE ORIGINAL TAPES WERE 7-TRACK, 556 BPI WRITTEN IN BINARY WITH BCD HEADER INFORMATION. WHEN THESE TAPES WERE CONVERTED TO 9-TRACK THE DATA WAS PADDED. THE BCD DATA WERE NOT CONVERTED TO ASCII. THE NUMERICAL VALUE OF EACH CHARACTER IS THE SAME AS IT WAS ON THE 7-TRACK TAPE. A LISTING OF THE CODES TO TRANSLATE THE CODES TO ASCII FOLLOWS. FOR THE MOST PART THESE TAPES WERE STACKED IN TIME ORDER, BUT THERE ARE SOME TAPES THAT WERE NOT. THE DR TAPES ARE 3480 CARTRIDGES AND THE DS TAPES ARE 9-TRACK, 6250 BPI. THE ORIGINAL TAPES WERE CREATED ON AN ICL 1900 COMPUTER AND THEY WERE RESTORED ON THE MRS SYSTEM. THE DR AND DS NUMBERS ALONG WITH THE CORRESPONDING D NUMBERS AND TIME SPANS ARE AS FOLLOWS:

DR#	DS#	D#	FILES	TIME SPAN

ARIEL 4

HIGH AND LOW SPEED MERGED DATA

71-109A-01A, 02A, 03A, 04A

This data set consists of 50 Low Speed and 425 High Speed Merged data tapes. They are 556 BPI, binary, 7-track, multi-filed. These tapes were created on the ICL 1900 series magnetic tape system, and contain 24-bit words.

The first 2 files of each tape contain BCD header information. The format of these files can be found on page 39 of the documentation. The number of files on each tape can be found in word 11 of the header file containing one record of 96 characters. This number does not include the two header files.

A smaple (10%) of the Ariel 4 tapes were duplicated and given 'C' numbers. A list of the tapes processed can be found on sheets 1A and 1B. The 'D' tapes were then sent to FRC (Federal Records Center).

Notes

1 The parity can be odd or even.

2 All zeros on tape are illegal in even parity.

This is the character code sheet for TI-109A-01A, 2A, 3A & 4A

Table 18 I.C.T. 1900 Series seven-track tape code

Chapter 16 Data interchange with industry compatible magnetic tape

The magnetic tape used on the 1900 Series magnetic tape systems is industry compatible magnetic tape. This means that data may be interchanged with the computer systems of other manufacturers through the medium of magnetic tape as long as the tape used by the other manufacturers is to the same industry compatible standards.

TAPE STANDARDS

Magnetic tape standards have been defined both by the European Computer Manufacturers Association and by the British Standards Institute.

The relevant standards for seven-track tape are E.C.M.A. 5 and B.S.S. 3968 and for nine-track NRZI tape E.C.M.A. 12. The proposed industry compatible standard for nine-track phase encoded tape has not yet been ratified.

The standards laid down define the physical properties of tape such as spool dimensions, tape width and thickness, recording mode and density, and the positioning of reflective strips. They do not define tape codes or label and block formats. E.C.M.A. 13 provides for tape labelling and codes.

TAPE CODES

Most computer manufacturers use IBM BCD code in even parity for data interchange on seven-track tapes, and IBM EBCDIC or USACII on nine-track tapes. These codes are shown in Tables 19, 20 and 21.

These codes are different from the 1900 Series tape codes and the 1900 Series internal machine code, therefore, the first step in any user program must be a translation routine. An example of such a routine is shown on page 141. Table 18 shows the 1900 Series seven-track tape code. As can be seen this code is based on the I.C.T. internal machine code with the four most significant bits inverted. With nine-track tape systems the 1900 Series word is recorded in three rows on tape as shown in Table 14 below.

	Tape track								
	1	2	3	4	5	6	7	8	9
Row 1	B5	B7	B3	P	B2	B1	B0	B6	B4
Row 2	B13	B15	B11	P	B10	B9	B8	B14	B12
Row 3	B21	B23	B19	P	B18	B17	B16	B22	B20

Table 14 1900 Series word format on nine-track tape

The system shown in Table 14 is used by other manufacturers. On reading an IBM nine-track tape, for example, three bytes (bits numbered 0 to 7) are represented in a 1900 Series word as shown in Table 15 below.

1900 Series word		
B0 B7	B8 B15	B16 B23
First byte	Second byte	Third byte
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7

Table 15 Representation of three bytes in a 1900 Series word

TAPE MARKS

The tape mark defined in the E.C.M.A. standard for seven-track tape differs from that currently used in industry compatible tape. The tape mark given in the E.C.M.A. 5 and B.S.S. 3968 standards is 0011111, i.e. odd parity. The IBM seven-track tape mark is 0001111, i.e. even parity.

The 1900 S-series seven track magnetic tape systems will write the tape mark X001111 [illegible] depending on whether the tape is in odd or even parity mode. On reading, the 1900 Series will treat any one row block of form X0X1111 as a tape mark, i.e. the parity bit and the bit in track 5 will be ignored. This means that both IBM and E.C.M.A. tape marks can be read on the 1900 Series seven-track tape systems.

With the nine-track NRZI tape systems a single tape mark is recorded; this mark is represented in store as 00010011, i.e. odd parity. Information on the tape marks used by the nine-track phase encoded tape systems is given in Chapter 1, page 5.

DATA INTERCHANGE METHODS

The 1900 Series normally operates in odd parity mode. The procedures outlined below must be followed to read a tape in even parity mode.

The tape deck on which the tape is loaded must be allocated to the program by the console allocation scheme, i.e. by the GIVE directive (see Chapter 7, page 39).

The console input directive

GIVE *#name x y* MODE 16

will cause Executive to allocate the tape deck *x* to the program *name* as its tape file *y*. Specifying MODE 16 means that the tape will be read and written in even parity at 556 characters per inch. It is important to note that since Executive cannot recognise the Header Label the change mode GIVE console directive (see Chapter 5, page 40) cannot be used and the console allocate GIVE directive as described above must be used instead.

After the tape has been allocated it can be read with a PERI instruction using mode #0.

Once the data has been read into store it must be converted into the 1900 Series internal machine code. It is not necessary to convert tape marks.

If the data input is not contained in an integral number of words, the remaining characters of the last word input will be filled with $ (dollar) characters in the case of seven-track tape and zeros in the case of nine-track tape. The dollar character will also effectively end a transfer when writing to seven-track tape. It is possible, therefore, to read or write variable length blocks with even parity on seven-track tape. Since nine-track tape only operates in odd parity the 1900 Series can only write an integral number of words. Any number of characters may be read.

The user program must examine the data that is read. The first block read will probably be a Header Label whose format must be known to the user. It is possible that other blocks may also be label blocks of various types.

It is important to note that the Magnetic Tape Housekeeping package cannot be used since the label and block formats will not be to Housekeeping standards.

Writing to tape is the reverse of the procedure described above. The data must first be assembled in the required format, converted to non-I.C.T. code and written to tape by a PERI instruction using mode #1.

CONVERSION ROUTINES

Seven-track tape

If conversion routines are used, it is a relatively simple matter to convert one tape code to another. Two conversion tables are given below, followed by a routine which makes use of the first table to convert I.C.T. internal machine code to IBM BCD seven-track code.

#66757677	#70717273	#64656122	#02416206

* The I.C.T. character ↑ is converted into the IBM character \ but not vice versa. The IBM character \ is converted into the I.C.T. character '(apostrophe) and vice versa.

I.C.T. TO IBM CONVERSION ROUTINE

A routine which makes use of the I.C.T. to IBM conversion table is given below.

It is required to write a block of 25 words to an IBM tape. These 25 words are held in store in the area starting at OUTPT. The 16 word conversion table is held in the area starting at TABLE.

Before the program is run the output tape must be allocated to it. If the tape is mounted on deck number 13, and it is sequired to write at 556 rows per inch in even parity, the console allocation message takes the form

GIVE 13 AS 0 MODE 24

or more simply

GI 13 0 24

In a multiprogram environment it is necessary to name the program, i.e.

GIVE *#name* AS 0 24

where *#name* is the program name.

The coding is as follows:

```
Label     Operation  Acc.  Operand
*LOWER
*TCON                    S/F1,0,25,0/OUTPT
*PROGRAM
          LDCT       2   100          [NO. OF CHARS.
          LDCH       3   OUTPT(2)     [PICK UP NEXT CHAR.
          SRC        3   2            [CONVERT TO CHAR. MODIFIER
          LDCH       4   TABLE(3)     [PICK UP EQUIVALENT CHAR.
          DCH        4   OUTPT(2)
          BCHX       2   *-4
          PERI       0   *TCON
```

It should be noted that if character #74 (dollar sign) occurs on output, special provision will have to be made as this is the terminate transfer character.

Nine-track tape

Provisions similar to those described above for seven-track tape must also be made for nine-track tape if non-I.C.T. tapes are to be read or written. It must be borne in mind, however, that the internal instruction repertoire of the 1900 Series is not really suitable for seven or eight level information.

As can be seen from Table 20, if data is alphanumeric only, i.e. numbers and alphabetic capitals, bits 0 and 1 can be ignored by the conversion routine. Alternatively, a shift character can be generated and the data converted into the 1900 Series internal shift code (see the reference manual *Basic Peripherals*, page 362, Table 53).

If the data is, for example, IBM packed decimal, i.e. each byte contains two four-bit decimal characters, no conversion is needed and a routine such as the one shown below will store the six packed decimal characters in X3 into six character locations starting at INPUT.

```
Label     Operation  Acc.  Operand
          LDCH       1   6
          STOZ           2
          SLL        23  4
          DCH        2   INPUT(1)
          BCHX       1   *-3
```

CONSTRUCTION OF CONVERSION TABLES

The method used to construct the I.C.T. to IBM table shown on page 140, together with the way in which the conversion routine utilizes this table is explained below.

The I.C.T. machine code characters are arranged in ascending order from the lowest to highest, i.e. from #00 to #77. The corresponding IBM tape characters are then paired with the I.C.T. characters, e.g. the I.C.T. character zero (#00) is paired with the IBM character zero (#12). The IBM character is then placed in character position 0 of Word 0 of the conversion table after the four most significant bits have been inverted. These four bits must be inverted as the 1900 Series hardware always inverts the four most significant bits of a character during a transfer. The IBM zero character (#12) is, therefore, placed in the conversion table as #66. The IBM character corresponding to the I.C.T. character #01 is then placed in character position 1 of Word 0 of the conversion table. This procedure is repeated until all the characters have been matched.

The routine makes use of the conversion table in the following manner. The I.C.T. character to be output to the IBM tape is loaded into a modifier. This character is converted into a character modifier by shifting it to the right two places with a SRC instruction. This character modifier is then used to modify the LDCH instruction which loads the corresponding IBM character from the conversion table. If, for example, the I.C.T. character to be converted is the letter A (#41), when used to modify TABLE (if TABLE is Word 0 of the conversion table) then the LDCH instruction will load TABLE+8.1 into the specified accumulator. This character will be the IBM letter A.

Tape code tracks 7654321	Character	Tape code tracks 7654321	Character

P101011	$	P001011	#
P101100	*	P001100	@
P101101	] (right bracket)	P001101	: (colon)
P101110	; (semi-colon)	P001110	> (greater than)
P101111	Δ (delta)	P001111	✓ (tapemark)

Note: IBM tapes are usually in even parity. If an attempt is made to write 000000 in even parity IBM tape decks will record 010000 (space character). IBM decks can write in odd parity and this mode is usually used for binary information in which case 000000 is a valid character.

Ariel-4 Data Processing

The Master Tape Format and Data Index

Contents

Introduction

The Form of the Master Tapes

This document defines in detail the formats of the Ariel 4 Experimenters' Master Tapes. It is an updated version of a previous document which, because it was written in stages, had its chapters written in an illogical order. However, in an attempt not to introduce any new errors the old chapter numbering has been adhered to. The following remarks are of general application and hold for all the data.

The tapes for the UK Experimenters are standard ICL 1900 tapes, recognisable by the ICL George operating system. They are 9-track ~~1600~~ 6250 bpi odd parity binary tapes. Tapes intended for use in the U.S. however have even parity file marks and are ~~7~~ 9-track, ~~556~~ 6250 bpi odd parity tapes.

All data values are expressed as binary integers 24 bits in length. For non-ICL users it should be noted that the 1906A is a two's complement machine.

The number of words in each record is divisible by 3 to aid Iowa's use of the tapes on their 18-bit-word computer. The Stages Tapes from which the Master Tapes are derived hold several files of High Speed or Low Speed data, when a file corresponds to a pass of the telemetry station in the case of High Speed data and to a play-back of the tape recorder in the case of Low Speed data. The files are broken down into one or more sub-files during the data reduction each of which consists of data containing no large time gaps. The High Speed tapes also contain processed Low Speed back-up data.

Thus each Master Tape commences with a Tape Header record followed by a series of Sub-files. The tape is then terminated with two Tape Marks.

Each Sub-file commences with a Tape Mark and a Sub-file Header Record. These are followed by Time Units which are four or two records long depending on whether the tape contains High or Low Speed data. In the case of High Speed tapes the Time Unit in the Sub-file is followed by two Crib Data Records (see Fig. 1).

For High Speed Tapes the data are divided into Time Units 16 sequences in length; the time of commencement of the Unit being chosen to coincide with the beginning of a Birmingham "sequence of measurements". Each time unit will commence with an Auxiliary Data Record containing data such as the position and attitude of the spacecraft at the time of the following experimental data. The next two records are referred to as the Birmingham and Iowa Record and the Birmingham or Iowa Record. The first contains data common to both satellite data modes; the second contains data arising from channels 1, 3, 5, 9, 11 and 13 (all frames) and are either Birmingham or Iowa data according to the satellite telemetry mode. The fourth data record contains Jodrell/RSRS data.

For Low Speed Tapes the Time Units are also 16 sequences in length. Each consists of two records (see Fig.2) the first being an Auxiliary Data Record and the second contains data from the Sheffield, Iowa and Birmingham experiments.

The tape records are all described separately in the following 8 chapters. The last chapter describes the data index of processed tapes held at Chilton.

Error Flags and Dummy Values

Contained within the records are flagwords indicating various malfunctions of the spacecraft. One word is allocated for each type of flag; the least significant 16 bits being used to indicate a fault in each of the 16 sequences in one Time Unit. Thus the bit pattern

0000000001000011000010 10

(the binary representation of the number 19,162) would indicate the fault occurs in sequences 2, 7, 8, 13 and 15.

Where a data value is missing for any reason or if it is outside the permitted range it will be replaced by a dummy value, which has been chosen to be -1234.7.

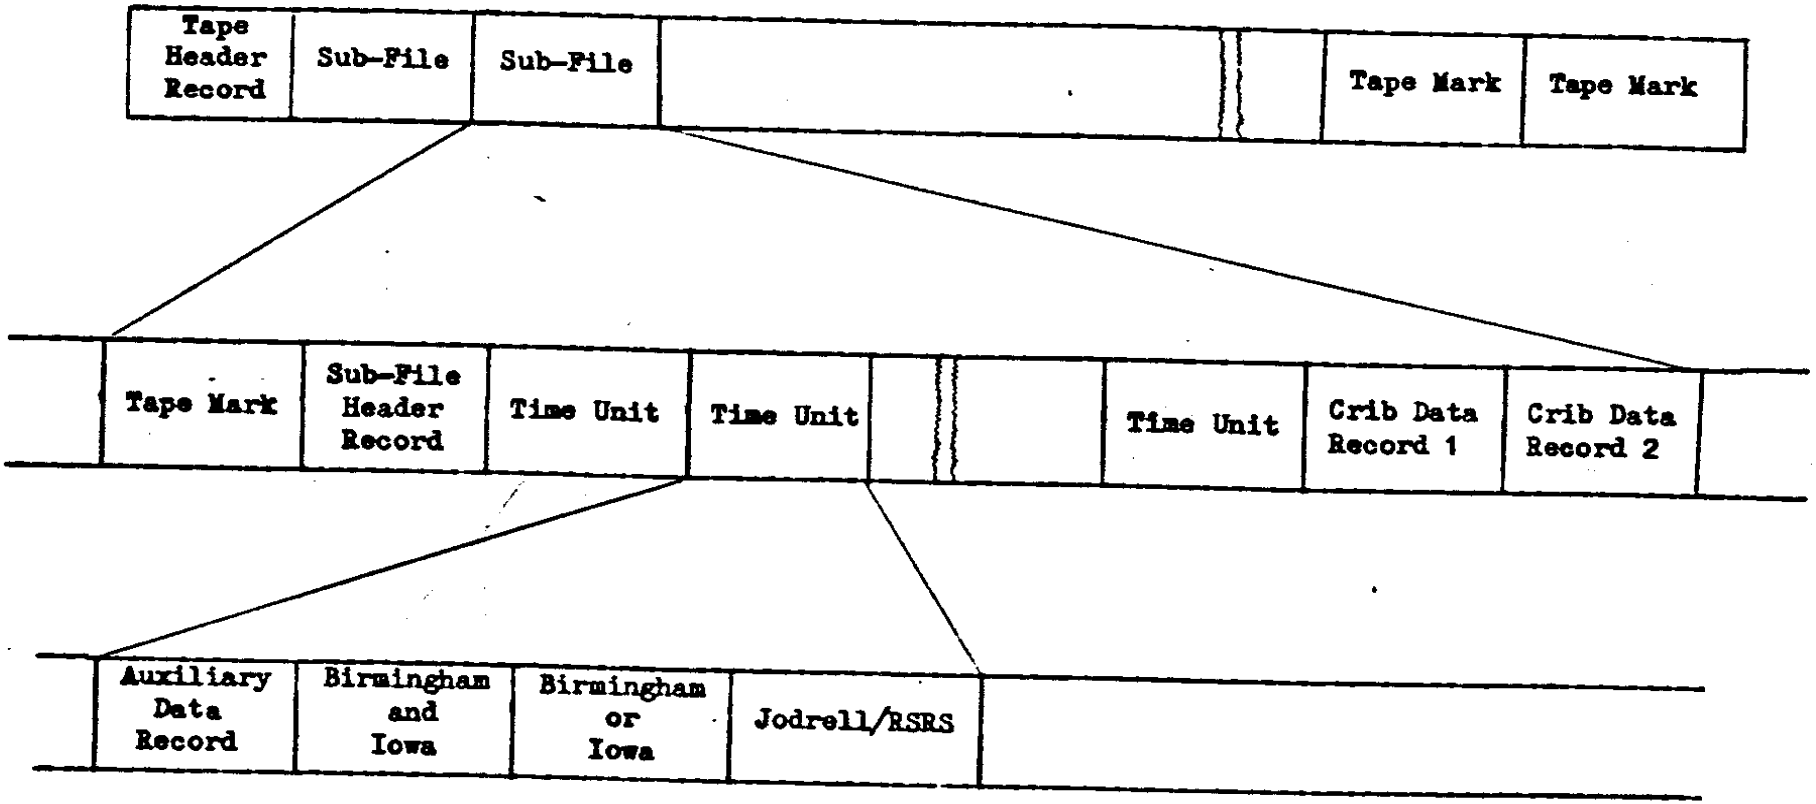

FIGURE 1: HIGH SPEED TAPE FORMAT

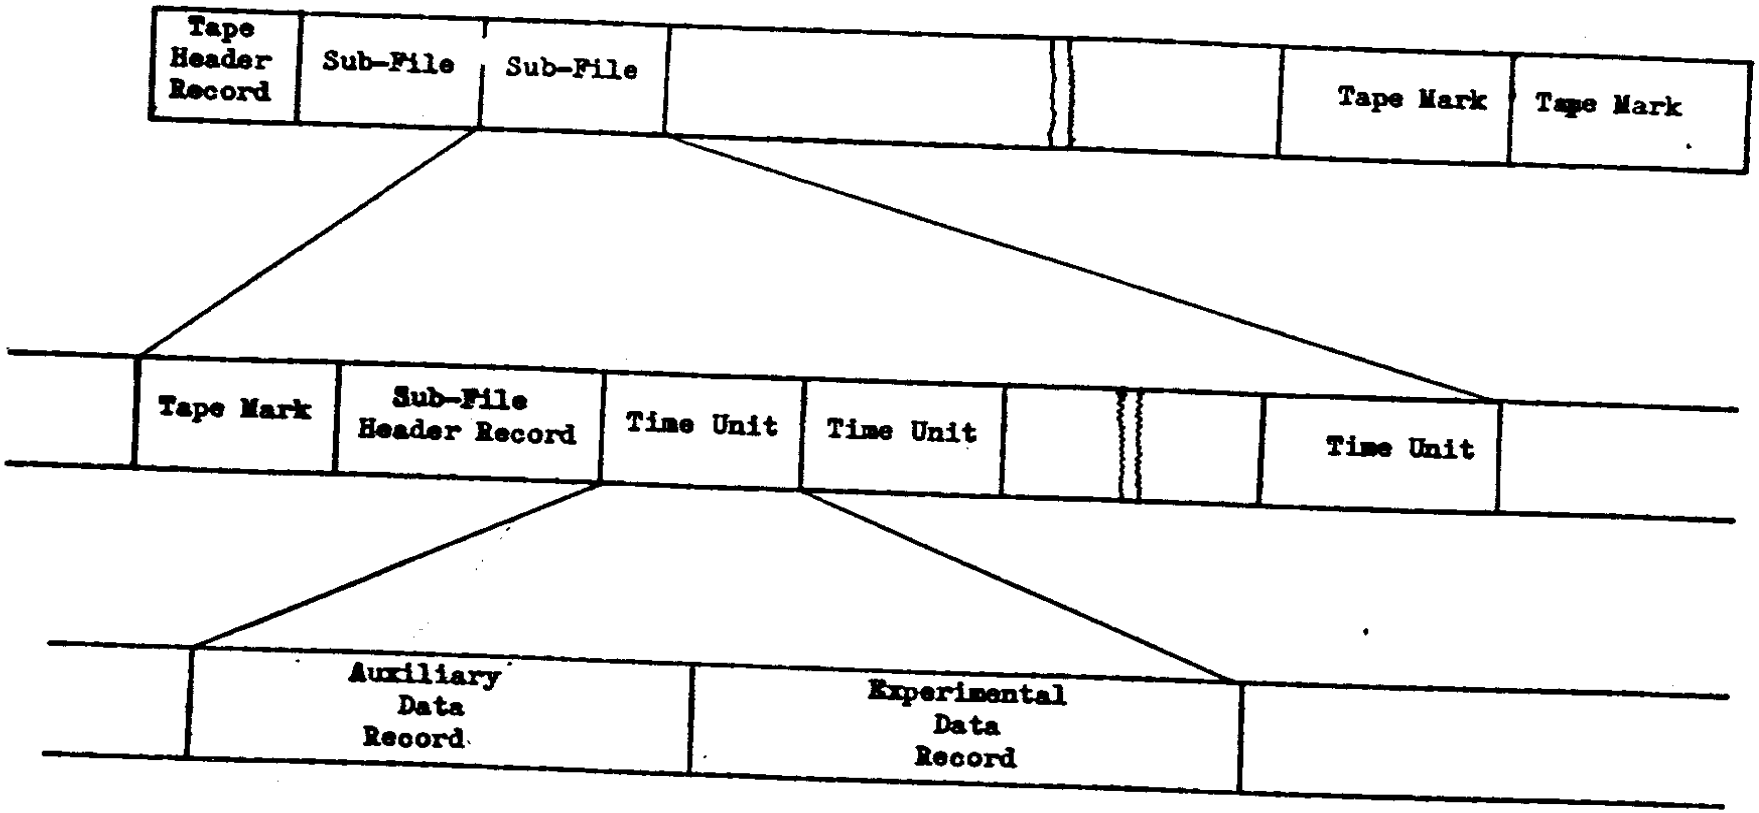

FIGURE 2: LOW SPEED TAPE FORMAT

Chapter 1. Birmingham High Speed

1. Introduction

It will be recalled that both Iowa and Birmingham data will be written in two records. The first, which we refer to as Birmingham and Iowa (or B and I) will contain data common to both satellite modes; the second, Birmingham or Iowa (B or I) will contain data arising from channels 1, 3, 5, 9, 11 and 13 (all frames) and will be either Birmingham or Iowa data according to the satellite mode.

To understand the output format it is necessary to give a short description of the mode of operation of the Birmingham experiment. During each time unit of 16 sequences the experiment goes through 8 sawtooth sweeps. In the first 4 sweeps both temperature and density measurements are output although the temperature data may be contaminated by the density experiment. In the latter 4 sweeps there are no density data output.

2. Definitions of output parameters

Symbols	Origin in Data Format		Description
	Channel	Frame	
(a) Modes 1 and 2			
D_1 - D_4	4	0 or 2	4 Electron Density measurements in units of 10^4 x log (electrons/m^3)
$B10_1$ - $B10_{16}$	"	4	16 Raw Voltages in mV
$P16_1$ - $P16_{16}$	15	1	16 Values of PP16 in mV
S_1 - S_{32}	10	0 and 3	32 Sweep Monitor Voltages in mV
(b) Mode 1 only			
DE_1 - DE_4	1,3,9,11	All	4 Densities estimated from the characteristic curves in units of 10^4 x $\log_{10}$ (el./m^3)
DV_1 - DV_{96}	"	"	96 Raw voltages from B1 or B2
$B3_1$ - $B3_{192}$	5, 13	"	Raw voltages in mV

(a) Modes 1 and 2

FD1 Both the B9's in a sweep dummy.

FD2 The two values of B9 in a sweep not equal.

FD3 This flag indicates a possible inconsistency between the two logarithmic amplifiers. Specifically, the flag will fly if B9 > 4.8V and B8 < 1.2V, or if B8 < 1.2V when both B9 values are dummy.

FD4 Dummy B8

FT1 Temperature experiment (B10) inoperative.

FT2 This flag indicates that the electron density (B8, B9) and spacecraft temperature are outside an envelope containing all the points where data correction is not necessary.

FT3 There may be an inconsistency between the two logarithmic amplifiers. The test used is B9 < 4.8V and B8 > 1.4V.

FM1 All sequences before synchronization.

FM2 Experiment off.

FM3 At least one of the two voltage sweep monitor values (B4) in a sequence dummy.

FM4 At least one of the two voltage sweep monitor values (B4) is a sequence outside permitted range.

FM5 PP16 value dummy.

FM6 PP16 value outside permitted range.

FS1 FS2 Spare Flags.

(b) Mode 1 only

The output waveform has 24 data points. This flag flies if the maximum value is not in the 5th or 6th points, or if both 5th and 6th data points are dummy. The first alternative indicates a severe wake and the second alternative suggests that the electron density value recorded will be too low by a significant amount.

FDE2 B1 or B2 is not consistent with B8 or B9.

FDE3 The test pulse maximum is outside the permitted voltage range.

FTE1 Temperature experiment (B3) inoperative.

FTE2 The electron density (B1, B2) and the spacecraft temperature are outside an envelope containing all the points where temperature compensation is not necessary.

FSE1 to
FSE7 Spare Flags

4. The Tape Format

Record B and I

Word Number	1 → 152	153 → 154	155 → 158	159 → 174
Parameter	Iowa Data	Spares	$D_1 \rightarrow D_4$	$B10_1 \rightarrow B10_{16}$

175 → 190	191 → 222	223 → 226	227 → 229	230 → 235	236	237
$P16_1 \rightarrow P16_{16}$	$S_1 \rightarrow S_{32}$	FD1 → FD4	FT1 → FT3	FM1 → FM6	FS1	FS2

Record B or I

Word Number	1 → 4	5 → 100	101 → 292	293 → 300	301 → 303	304 → 305	306 → 312
Parameter	$DE_1 \rightarrow DE_4$	$DV_1 \rightarrow DV_{96}$	$B3_1 \rightarrow B3_{192}$	Spares	FDE1 → FDE3	FTE1 → FTE2	FSE1 → FSE7

5. Notes

1. The flags FT1 and FTE1 will always be set because the temperature experiment is inoperative.

2. When the experiment is first turned on the various parts of the experiment are not in synchronisation with one another until the first occurence of Frame 1, Channel 7 in the low speed data. Until this occurs the flag FM1 will be set. In addition the sweep itself is not in synchronisation with the telemetry until the first occurence of a HS Synch. (Frame 0, Channel 0). Data in the part sequence before this should be ignored.

3. A Birmingham Monitor/Flag will be set in the sub-file header to indicate the modes of the experiment during the sub-file. This is described in Chapter 6.

Chapter 2. Iowa High Speed Data

1. Introduction

This document follows the lines of the previous one on Birmingham High Speed data. As a reminder, we restate that there will be two records for Iowa and Birmingham data. The first, B and I, contains data common to both satellite modes: the second, B or I, contains data from channels 1, 3, 5, 9, 11 and 13 (all frames).

2. Definitions of Output parameters

The following symbols are used for the different parameters:

Ga : Integral particle intensity measured by the Geiger-Mueller Tube in LEPEDEA A. Units are $10^3 \times \log_{10}$ (particles/cm-s-sr)

Gb : Integral particle intensity measured by the Geiger-Mueller Tube in LEPEDEA B. Units are $10^3 \times \log_{10}$ (particles/cm-s-sr)

C1 to C36 : Differential particle intensity in $10^3 \times \log_{10}$ (particles/cm-s-sr-eV) The numbering refers to successive outputs from channels 1, 3, 5, 9, 11, 13, being 36 in all in one sequence.

P18A : Performance parameter 18A measured in mV

P18B : Performance parameter 18B measured in degrees

S1 to S4 : Step Monitor in mV, 4 per sequence

N : Assumed Step Number - an integer between 5 and 13

M : Assumed experiment mode expressed as an integer according to the following table:

M	Explanation
0	Mode not identifiable
1	Calibration Mode
2	Experiment OFF
3	Mode 1 (α Sequence)
4	Mode 1 (β Sequence)
5	Mode 2
6	Mode 3
7	Mode 4
8	Mode 5

3. Error Flags

Flag number	Fault
F1	There is at least one dummy data point in the data sequence
F2	PP18A or B are suspect or dummy
F3	One of the 4 step monitors in the sequence is not consistent with the assumed Mode
F4	More than one of the 4 step monitors in the sequence is not consistent with the assumed Mode
F5	At least one of the step monitor values is dummy
F6 -F8	Spares

4. The Tape Format

Record B and I

Word Number	1	2	3	4	31	32	33 → 40	41 → 48
Parameter	Ga_1	Gb_1	Ga_2	Gb_2	Ga_{16}	Gb_{16}	$P18A_1 \rightarrow P18A_8$	$P18B_1 \rightarrow P18B_8$

	49	50	51	52	112	113 → 120	121 → 136	137 → 152	153 → 237
	$S1_1$	$S2_1$	$S3_1$	$S4_1$	$S4_{16}$	F1 → F8	N1 → N16	M1 → M16	Birmingham Data

Record B or I

Word Number	1	2	36	37	576	577-579
Parameter	$C1_1$	$C2_1$	$C36_1$	$C1_2$	$C36_{16}$	Spare

5. Notes

1. The subscripts denote the sequence numbers (except for the PP's, where they denote pairs of sequences).

2. This numbering system for each parameter is not uniform with that used for the Birmingham Data because of the essentially different nature of the two experiments.

3. If the Mode cannot be established (i.e. M = 0) or the experiment is in Calibration mode (M = 1) the particle measurements will be left as particle counts, without the final multiplication by the geometric factor.

4. In modes 3, 4 and 5 (M = 6, 7 and 8) the Step Number N will indicate the energy step level for each sequence. In the other modes this parameter should be ignored as the energy steps will be following a set pattern in each sequence.

5. The flags will be written in exactly the same way as for Birmingham so that the position of the bit set in the 16 least significant bits of the word corresponds to the number of the sequence in which the error occurs.

6. Certain conditions appertaining to the entire sub-file are indicated in the sub-file header. These indicate:-

1. the experiment mode(s) during the sub-file
2. if the calibration is wrong
3. the state of the Birmingham/Iowa data switch.
4. the percentage of inconsistent step-monitors occurring.

Further details of these are given in Chapter 6.

7. Details of the Iowa experiment may be obtained from the "Experiment Requirements Document" University of Iowa, May 1970.

Chapter 3. Jodrell/R.S.R.S.

1. Introduction

This chapter describes the format of the record on the High Speed Master Tapes containing data from the Jodrell/R.S.R.S. experiment.

2. Definitions of Output Parameters

Symbols	Origin in Data Format		Description
	Channel	Frame	
SS1→ SS2	-	-	Indicator of start of frequency sweeps (See note 5)
GF1→ GF3	-	-	Gyro-frequency used for frequency normalisation in each sweep. (See note 6)
N1→ N18	2,7,12	All	HF noise measurements in dB. The numbering refers to successive outputs in one sequence.
FR1→ FR18			10^6X Normalised frequencies corresponding to the noise outputs.
AG1, AG2	8	0,3	Receiver A.G.C. in dB
AF	10	2	Approximate frequency in kHz from C2.
P13	4	1	Temperature from PP13, in degrees.

3. Error Flags

Flag number	Fault
F1	All noise data in sequence dummy
F2	Some noise data in sequence dummy
F3	The calculated frequency does not agree with the frequency given by C2
F4	Marker occurs in position incompatible with assumed frequency sweep

4. The Tape Format

Jodrell: Modes 1 and 2

Word Number	1	2	3	4	5	6	7	8	9	41	581
Parameter	SS1	SS2	GF1	GF2	GF3	$N1_1$	$FR1_1$	$N2_1$	$FR2_1$	$FR18_1$	$FR18_{16}$

582	583	613	614	629	630	645	646 → 649	650 → 651
$AG1_1$	$AG2_1$	$AG2_{16}$	AF_1	AF_{16}	$P13_1$	$P13_{16}$	F1 → F4	Spares

Jodrell: Mode 3

Word Number	1	2	18	19	288	289	290	320	321	336	337	352	353	354	355 → 357
Parameter	$N1_1$	$N2_1$	$N18_1$	$N1_2$	$N18_{16}$	$AG1_1$	$AG2_1$	$AG2_{16}$	AF_1	AF_{16}	$P13_1$	$P13_{16}$	F1	F2	Spares

5. Notes

1. The subscripts denote the sequence numbers.

2. The Jodrell Modes are taken to be as indicated.

Mode	Operation
1	Alternate swept frequency and fixed frequency
2	Swept frequency only
3	Fixed frequency only

3. If the experiment is in Mode 3 there is no need for the calculated frequencies on the Master Tapes. The alternative record format for this mode is indicated in Section 4.

4. The flags will be written in exactly the same way as for Birmingham, so that the position of the bit set in the 16 least significant bits of the word corresponds to the number of the sequence in which the error occurs.

5. The start of each frequency sweep (SS) is indicated by the number of the output channel. The start of 2 sweeps can occur in one record, since the record length is 28 secs. and the sweep time 16 secs. The numbers 12, 506 in words 1 and 2 would thus indicate that the 12th and 506th words of the record are the first noise values in the two sweeps. These words will in fact contain zeros because the noise is suppressed for the first 6 or 7 outputs at the start of a sweep.

6. The frequency FR is normalised to the local gyrofrequency which is calculated from the local magnetic field derived from the IGRF. Up to 3 sweeps or portions of sweeps can occur; if there are only 2 then GF3 (Word 5) will be zero and SS2 is undefined.

7. Certain errors appertaining to the entire sub-file are indicated in the sub-file header. These indicate:-

1. The experiment mode (including On/Off)
2. There is at least one marker in the sub-file incompatible with the assembled frequency sweep.
3. The duration of the sweep and the position of the markers has been estimated by using information from adjacent files.
4. The position of the markers has been estimated by using information from adjacent files.

Further details are given in chapter 6.

8. In the interval between launch and the deployment of the Jodrell/RSRS aerials the values output in P13 are not really temperatures and should be ignored.

Chapter 4. Auxiliary Data

1. Introduction

This chapter describes the format of the record giving data relating to the position and attitude of the satellite. The forms of the records for Low and High Speed data are as far as possible the same, but differences occur because of the lack of the roll phase sensor data on Low Speed and also because the time units to which the records correspond are of different length in the two cases.

2. Definitions of Output Parameters

(a) High and Low Speed

			See Note
UT	Universal Time	(Hours ((Minutes ((Seconds ((Milliseconds	15
LT	Local Solar Time	(Hours ((Minutes ((Seconds ((Milliseconds	15

FT	Flag indicating that torquing is occurring		12
FP	Roll Phase Flag indicating nearest sun pulse is far removed in time		9,10
FE	Eclipse Flag (high speed only)		10
(c) Low Speed Only			
FEL	Eclipse Flag (low speed only)		10

3. The tape format

(See pages 7 and 8).

4. Notes

1. All the physical quantities in the high speed record are given three times. The first corresponds to conditions for Frame 0, Channel 0 of the first sequence in the time unit, the second to Frame 0, Channel 0 of sequence 9 and the third to the sequence immediately following the last one in the record. Thus the last set in each record will be repeated as the first set in the following record. Linear or quadratic interpolation is thus possible using data from the current record alone.

In the low speed record the quantities are given 17 times, corresponding to Frame 0, Channel 0 of each sequence in the record, plus the following sequence. The chosen repetition rate means that the quantities are given every 14 seconds in High Speed and 28 seconds for Low Speed Data.

2. The Geomagnetic quantities are all derived from an eccentric dipole whose direction and displacement are as given in "Physics of Geomagnetic Phenomena" Vol. 2 Appendix 1, ed. Matsushita and Campbell.

3. All other magnetic quantities and coordinates are derived using the International Geomagnetic Reference Field 1965, updated to 1972.

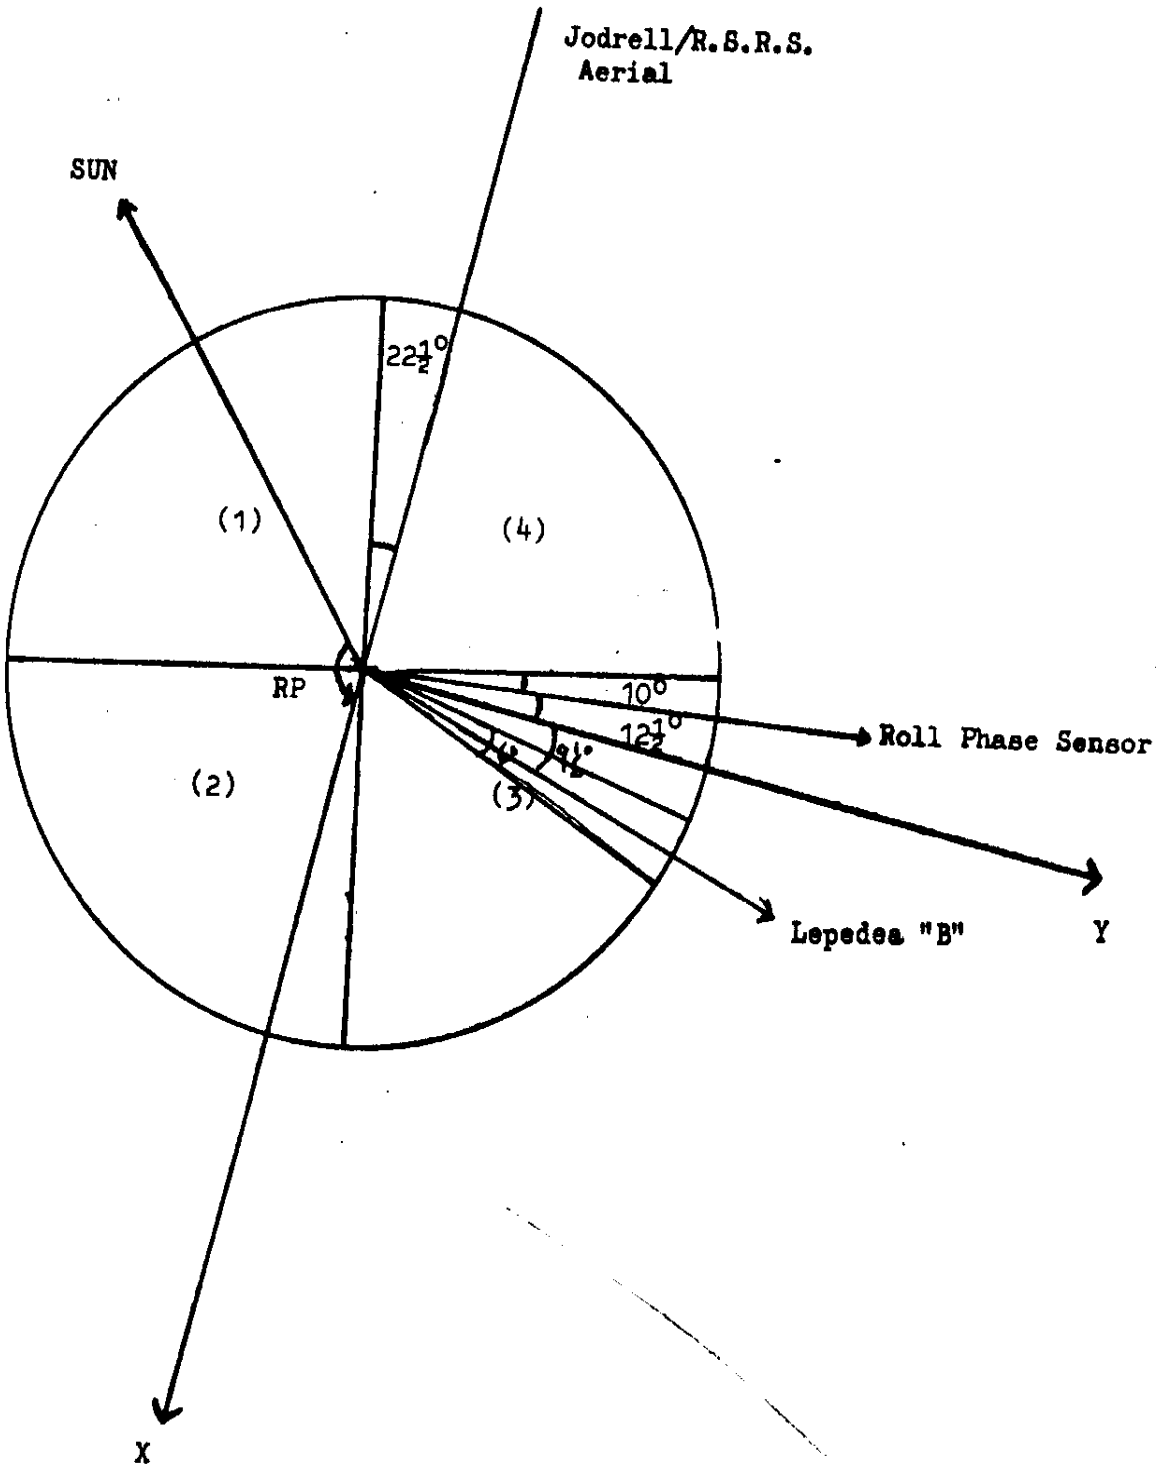
4. The L value will be given for all possible positions of the satellite. However to avoid overflow, when its value is greater than 10,000 the number 10,000 will be given on the Master Tape.

5. The axes used for expressing the components of magnetic field, satellite velocity and attitude are an inertial geocentric cartesian system such that X is in the direction of the first point of Aries, Z is in the direction of the North Pole and Y completes a right-handed set.

6. The satellite axes used for giving the satellite attitude and roll phase are shown in the diagram.

The numbers refer to the satellite quadrants and these and the angles shown are taken from a B.A.C. diagram dated 1/3/70 "Position and coding of equipment in centre tube and on top cone of spacecraft". The Z axis is in the direction of the spin axis and forms a right handed set.

Direction cosines of X and Y relative to the inertial coordinates will be given for high speed data only. The direction cosines of the Z axis, which is assumed to be constant for the duration of a pass, is given in the sub-file header record, which is described in Chapter 6.



The Satellite Coordinate Axes X and Y

7. The roll phase, RP, is the angle the plane containing the X and Z axes makes with the plane containing the sun direction and the Z axis. This is also shown on the diagram for the sun lying in an arbitrary direction.

8. In the event of no roll phase sensor data being available for the pass, the direction cosines of the X and Y axes and the roll phase will all be set to zero.

9. If the nearest sun pulse observed by the roll phase sensor occurred so far away in time that the accuracy of the attitude calculations cannot be guaranteed the roll phase flag FP will be set to unity (otherwise zero). The attitude quantities will still be calculated and the flag indicates that caution is needed.

10. Calculations are performed using the positions of the sun and satellite relative to the earth to determine if the satellite is in shadow. If the satellite is in eclipse the flag FE is set to unity. Since approximations for the effects of the earth's atmosphere are included, and may not prove accurate, this flag may not coincide exactly with the absence of sun pulses in the roll phase sensor.

Please note that this flag, FE and FP are special flags in that the word as a whole is set to unity; so also are the flags FTP and FW in the HS data only if any of the 3 calculations in the time unit gives a positive indication. All the others (both high and low speed, including the low speed eclipse flag, FEL) have individual bits set as described in the Introduction.

11. The flag FTP is set on information received from R.A.E. and indicates that the sequence is within a torquing "phase". For this purpose a torquing phase is deemed to exist from the beginning of a series of torquing operations until the end. During this period torquing will not be taking place continuously, but the spin axis direction as calculated may be seriously in error.

12. The flag FT is set if torquing is actually taking place and is derived from PP19A. Thus only alternate bits are set if torquing is occurring.

13. The integrated electron flux IEF has not been implemented to date.

14. The flag FW is set if the angle, θ, between the spin axis and the velocity vector is such that $\pm 46^{\circ} < \theta < \pm 94^{\circ}$

15. Where a real parameter is divided up into its integer and fractional parts the number can be reconstituted by adding together the parts (multiplied by the appropriate power of ten) regardless of sign. For example Geographic Latitude - 61.856 is written on the tape as the two numbers - 62 and 144. Thus $-62 + 144 \times 10^{-3} = -61.856$.

16. As the parameter GMLT passes through 24 hours increasing or 0 hours decreasing, no attempt is made to subtract or add 24 hours. The limits on the GMLT observed during a pass and output in the sub-file header thus represent a true range of values since no artificial discontinuities are introduced.

UK-4 Data Processing

The Master Tape Format

Chapter 5: Low Speed Experimental Data

1. Introduction

To keep the amount of tape wasted on inter-record gaps to a minimum the data from all the experiments are combined into one record. With 16 low speed sequences to a time unit this gives a record length for the experimental data of 510 words and for the auxiliary data 669 words (see Chapter 4). These two records will alternate on the tape.

2. Definitions of Output Parameters

Symbols	Origin in Data Format		Description
	Channel	Frame	
N1 → N17	1→5,9,13	0	Sheffield VLF noise in dB above $10^{-15}\ \gamma^2\ Hz^{-1}$ x 10 (see Note 8)
	2,4,9 →15	1	
I1, I2	6,7	0	Impulse counts at 3.2 and 9.6 kHz
D	6 or 7	1	Birmingham electron density expressed as 10^4 x $\log_{10}$ (electrons /m^3)
T	8	1	Birmingham electron temperature channel in mV
C1 →C5	10,12,14	0	Iowa differential particle intensity as 10^3 x $\log_{10}$ (particles/(cm-s-sr-eV)).
	1,3	1	
G	5	1	Iowa integral particle intensity as 10^3 x $\log_{10}$ (particles/(cm-s-sr)).
M	8	0	Iowa Mode in mV
S	15	0	Iowa step monitor in mV
AS			Iowa assumed step number - an integer between 5 and 13 (see Note 6)
AM			Iowa assumed mode (see Note 4)

3. Error Flags

Flag	Experiment	Interpretation
FS1	Sheffield	At least one of the data values is dummy
FS2	"	A calibration is in progress
FI1	Impulse Counter	At least one of the two counts is dummy
FI2	"	" " " " " " " " outside the 0 to 5 V range
FB1	Birmingham	Possible inconsistency between B5 and B6; both density channels dummy or B5 dummy when B6>4.8V
FB2	"	There is an inconsistency between the two logarithmic amplifiers. That is B6>4.8V and B5<1.2V, or B6<4.8V and B5>1.4V.
FB3	"	Temperature channel (B7) dummy (See Note 1)
FB4	"	Densities may be in error (See Note 2)
FU1	U. of Iowa	At least one data value dummy
FU2	"	Mode ident dummy or inconsistent
FU3	"	Step monitor is inconsistent with the mode ident or is dummy

4. The Tape Format

See page 32.

5. Notes

1. This flag will always be set because the Birmingham temperature experiment is inoperative.
2. This flag is set if the electron density and the spacecraft temperature are outside an envelope containing all the points where data correction is not necessary.
3. The subscripts denote the sequence numbers.
4. The assumed mode of the Iowa experiment, AM, will be expressed as an integer according to the following table:

AM	Explanation
0	Mode not identifiable
1	Calibration mode
2	Experiment Off
3	Mode 1 (LEPEDEA 'A')
4	Mode 1 (LEPEDEA 'B')
5	Mode 2 (LEPEDEA 'A')
6	Mode 2 (LEPEDEA 'B')
7	Mode 3
8	Mode 4
9	Mode 5

5. If the Mode of the Iowa experiment cannot be established (i.e. M = 0) or the experiment is in Calibration mode (M = 1) the particle measurements will be left as particle counts, without the final multiplication by the geometric factor.

6. For Iowa modes 3, 4 and 5 (M = 7, 8 and 9) the Step Number N will indicate the energy step level for each sequence. In the other modes this parameter should be ignored as the energy steps will be following a set pattern in each sequence.

7. The following conditions for the entire subfile are indicated in the sub-file header.

    1. Iowa modes.
    2. Birmingham modes.
    3. Iowa calibration wrong.
    4. Iowa quality flag

Further details of these are given in Chapter 6.

8. The Sheffield parameters are output in the following order, thus grouping together the Peak, Min and Mean values for increasing frequency.

Word Number	Origin in Telemetry Format		Designation in Telemetry Format	Function	Frequency
	Channel	Frame			
1	1	0	K 7	Peak	0.75 kHz
2	2	0	K 8	"	1.25 "
3	3	0	K 9	"	3.2 "
4	4	0	K10	"	9.6 "
5	5	0	K11	"	16.0 "
6	9	1	K17	Mean	0.75 "
7	10	1	K 1	"	1.25 "
8	11	1	K 2	"	3.2 "
9	4	1	K16	"	9.6 "
10	2	1	K15	"	16.0 "
11	12	1	K 3	Min.	0.75 "
12	13	1	K 4	"	1.25 "
13	14	1	K 5	"	3.2 "
14	15	1	K 6	"	9.6 "
15	9	0	K12	"	16.0 "
16	11	0	K13	Min. Narrow Band	16.0 "
17	13	0	K14	" " "	17.8 "

Chapter 6. The Sub-file Header

1. Introduction

The concept of the Sub-file was introduced in the document "UK-4 Experimenter Tapes" ACL, 15/2/71. A file (i.e. pass or play-back) will be divided into two or more sub-files if there is a large time gap in the data. The sub-file header will be located before the data in each sub-file. There will be a tape-mark before each sub-file header record.

2. Definitions of output parameters

(a) High and Low Speed

		See Note
NRECS	number of time units in the sub-file	
NSUB	sub-file number on the Master Tape	12
NOSF	total number of subfiles in the file	
SFNO	sub-file number in the file	
YR	year	
DAY	day	
HR	hour	5
STA	station number	
BTN	buffer/stage tape number	
NSTAGE	file number on the Stage Tape	
STAT	start time (Hours, Minutes, Seconds)	1
STOT	stop time (Hours, Minutes, Seconds)	1
TEC	time of equatorial crossing in degrees	2
MINL	minimum invariant latitude in degrees	
MAXL	maximum invariant latitude in degrees	
MINGT	minimum geomagnetic time in degrees	2
MAXGT	maximum geomagnetic time in degrees	2

		See Note
SL) SM) SN)	solar direction cosines Units x 10^{-6}	6
ZL) ZM) ZN)	spin axis direction cosines Units x 10^{-6}	6
THETA	angle between the sun and the spin (or Z) axis in degrees	
TEMP	assumed temperature for the VCO conversion in degrees	7
ITEMP	assumed Iowa temperature in degrees	7
IU	University of Iowa calibration wrong	3
MU	University of Iowa Mode indicator	8
MB	Birmingham Monitor and Flag	9
IQ	University of Iowa Quality Flag	13

(b) <u>High Speed Only</u>

MJ	Jodrell/R.S.R.S. Mode	10
MS	Satellite Mode	11
PER	period of rotation in milliseconds	14
SUBCOM	indicator that an "A" or "B" sequence is first in the sub-file	4
FJ1	Jodrell/R.S.R.S. At least one marker in the sub-file is incompatible with the assumed frequency sweep.	3
FJ2	Jodrell/R.S.R.S. The duration of the sweep and the position of the markers throughout the sub-file has been estimated by using information from adjacent files	3
FJ3	Jodrell/R.S.R.S. The position of the markers throughout the sub-file has been estimated by using information from adjacent files	

3. Notes

1. The start time and stop time for both low and high speed data will be the times of the first and last sequences in the sub-file (calculated from the replay times in the case of the low speed date).

2. The time of equatorial crossing and the maximum and minimum geomagnetic time will be given in degrees to correspond with the times given in the Index. In order to make these limits meaningful, if the time crosses a 360° or 0° boundary no adjustment is made. Thus it is possible for negative values and values greater than 360° to occur. If no equatorial crossing occurs during the sub-file TEC is given the value 999.

3. The flags for Iowa (FU) and Jodrell/R.S.R.S. (FJ1 to FJ3) will be set to unity in the case of an error and will otherwise be zero.

4. The value of SUBCOM will be set to 1 if the first sequence in the sub-file is an "A" sequence and 2 if it is a "B" sequence.

5. The hour (HR) given will be that copied from the Buffer Tape Ident. It may not correspond exactly with the hour given for the start time (STAT).

6. The direction cosines for the solar direction (SL, SM, SN) and the spin axis direction (ZL, ZM, ZN) will be relative to the inertial geocentric cartesian coordinate system described in Chapter 4.

7. The assumed temperature, TEMP, is the Sheffield temperature from PP 19B, selected for each day from the housekeeping quick look data and used for correcting the VCO conversion tables. Similarly ITEMP is the Iowa (after failure on 29.4.72., Jodrell) temperature used for correcting the Iowa conversion tables.

8. The University of Iowa Mode indicator (MU) will have values corresponding to the table given in Chapter 2 for High Speed Data and Chapter 5 for Low Speed Data. However since the Iowa ON/OFF command is a primary command the experiment could be in several modes during a sub-file. The states will be indicated by the digits of the decimal representation of the word. For example in a high speed tape if the value of MU is 52, this indicates the

experiment was in Mode 2 at the start of the sub-file but was switched off before the end of that subfile.

9. The Birmingham Monitor/Flag (MB) will be set according to the following table

MB = 1 Birmingham experiment ON

2 Birmingham experiment OFF

3 Birmingham is ON but it is impossible to find out where the time units of 16 sequences start.

The Birmingham OFF command is also a primary command and this experiment could be in three different modes during a sub-file. For High Speed data, therefore, the flag may consist of up to three digits, each indicating the experiment mode. In the case of Low Speed Data, however, the flag will be one digit. If the experiment is OFF for the entire sub-file the flag will be set to 2, otherwise its value will be 1.

10. The Jodrell/R.S.R.S. Mode (MJ) will be as follows

MJ = 0 Experiment OFF

1 Alternate swept frequency and fixed frequency

2 Swept frequency only

3 Fixed frequency only

Since the Jodrell mode switch is a secondary command only one mode can occur in a sub-file. MJ can thus only take the values 0, 1, 2 or 3.

11. The satellite mode, MS indicates the state of the Birmingham/Iowa data switch

MS = 1 indicates Birmingham data in Channels 1, 3, 5, 9, 11, 13

2 indicates Iowa data in Channels 1, 3, 5, 9, 11, 13.

12. NSUB indicates the position of the sub-file on the Master Tape. It may thus be used for skipping tape-marks in order to bypass unwanted sub-files.

13. The University of Iowa quality flag IQ is a summary of flags F3 and F4 in the Iowa data. It gives the percentage of step monitors occurring in the sub-file which are inconsistent with the expected value.

14. If no sun pulses occur during the sub-file, the period cannot be calculated. In this case the period, PER, is set to zero.

4. The Tape Format

High Speed Sub-file Header Record

Word Number	1	2	3	4	5	6	7	8	9	10	11 → 13	14 → 16	17	18	19

Word Number	1 → 32	33	34	35 → 36
Parameter	As above	IQ	ITEMP	Spares

Chapter 7. The Tape Header Record

1. Introduction

The Master Tape header record will commence with the standard I.C.L. tape header which is 9 words long. For the British experimenters this means that the Master Tapes will be recognised by the I.C.L. George operating system. The I.C.L. tape header is described in the 1900 Magnetic Tape Manual, Chapter 6. The exact meaning of these 9 words may however be changed and experimenters are recommended not to use these words. If this is unavoidable please contact Mr. A. Walter at Chilton.

2. Definitions of output parameters

(a) Standard I.C.L. Tape Header

		See Note
HDDR		1
TSN	Tape Serial Number	2
FN	File Name	3
RSN	Reel Sequence Number	4
FGN	File Generation Number	4
RP	Retention Period	4
DW	Date Written	5

(b) Other parameters in the record

		See Note
TS	Tape Speed-High or Low	6
NSF	Total number of sub-files on tape	
FYR, FDAY, FHR	Year, Day, Hour of the first sub-file	
LYR, LDAY, LHR	Year, Day, Hour of the last sub-file	
FNO	Type number of the format	7
BTN	Buffer/Stage Tape Number or Numbers	8

3. Notes

1. The first word consists of the characters HDDR.
2. TSN will be the Tape Serial Number of the Master Tape and FGN is the Master Tape number.
3. The File name (FN) is three words long and consists of the twelve characters MASTER TAPE1
4. The two words RSN and RP are zero.
5. The Date Written, DW, is measured in days from 1 January 1900.
6. The tape speed, TS is set to 1 if the tape contains High Speed Data and is set to 2 if the tape contains Low Speed (Recorded) Data.
7. The Type number of the format, FNO, was initially set to unity and will be set to two for the production Master Tapes.
8. The Stage/Buffer Tape Number (or numbers), BTN,indicate from which Buffer/Stage Tapes the files on the Master Tape have been derived Up to 5 different tapes have been allowed for.

The Tape Format

The Tape Header Record

Word Number	1	2	3 → 5	6	7	8	9	10	11	12	13	14	15	16	17	18	19 → 23	24
Parameter	HDDR	TSN	FN	RSN	FGN	RP	DW	TS	NSF	FYR	FDAY	FHR	LYR	LDAY	LHR	FNO	BTN	Spare

CHAPTER 8. THE CRIB DATA RECORD

1. Introduction

The Crib data present in a High Speed data sub-file will be extracted during the processing of that sub-file. After reformatting it will be processed by the Low Speed Programs. The data will then be output on the High Speed Master Tape immediately following the end of the High Speed data for that sub-file. The maximum number of reconstituted Low Speed sequences in a sub-file is less than 30. The Crib Data can thus be written within two records each 16 sequences long (two records will always be output completed with dummy values where necessary). These records will have the same format as the Low Speed Experimental Data Record (described in Chapter 5) with the addition of 16 universal times corresponding to Frame 0 Channel 0 of each sequence. Each time will consist of four words

1. Hours HR
2. Minutes M
3. Seconds S
4. Milliseconds MS

2. Crib Data Record Format

Word Number	1 → 507	508	509	510	511	512	571	572 → 573
Parameter	Low Speed Data	HR_1	M_1	S_1	MS_1	HR_2	MS_{16}	Spares

N.B. There will not be a tape mark between the last of the high speed data records and the first of the two crib data records. There will of course be one before the next sub-file header record.

Chapter 9. The Data Index

The index has been changed in several ways from the SATREF index produced for Ariel 3. This note is to draw attention to the changes and to describe briefly the different entries.

The index will be produced in different versions. For experimenters there will be two versions, high speed and low speed. For internal use there will be further high and low speed versions. A second change is that the basic unit listed will be sub-file rather than a file (a file is divided into two or more sub-files if there is a large time gap in the data). A further change is that the index will be listed in a complete form, rather than just printing out days which have changed since the last version. As a result considerable paper will be generated each time the index is produced and one would envisage less frequent listing than for Ariel 3. These listings will be produced at the experimenter's request and will not be generated automatically. It is hoped eventually to provide a facility for experimenters to make selected listings for say, specific stations or on any other of the listed parameters.

Two items have been omitted from the experimenters' indices which were given in the SATREF index. The first is the orbit number and the second the SATAN diagnostics. Several new parameters have been added and the full lists are given on the following pages.

A. Experimenters High Speed Index

1. The Master Tape number.
2. The number of the file on the Master Tape.
3. The number of the sub-file in the file.
4. The number of the sub-file on the Master Tape.
5. Year number.
6. Day number.
7. Hour number.
8. Station number.
9. Stage/Buffer Tape number.
10. Start time of sub-file in hours, minutes and seconds.
11. Stop time of sub-file in hours, minutes and seconds.
12. Satellite Mode - 1 or 2.
13. Birmingham ON/Off - 0 for off, 1 for on, with the possibility of two switches occurring during the sub-file, thus requiring three digits.
14. Iowa Mode - the indicator will have the same values as on the Master Tape. Again three digits will be required.
15. Jodrell Mode - as on Master Tape, one digit.
16. The date of the Master Tape generation as day, month, year.
17. Bad sub-file indicator. This will be set to 1 if a more recent (and better) version of the sub-file is available. It will have the value 2 if the sub-file is bad, but no other version exists. In either case the data should not be used.
18. Time of equatorial crossing measured in degrees (15° to 1 hour) for compactness in writing. This indicates the first northbound crossing. If no equatorial crossing occurred during the sub-file, the value 999 will be output.

19. The range of invariant latitude, expressed as minimum and maximum.

20. The range of local geognetic times, again measured in degrees. These values may sometimes be outside the range 0° to 360°.

21. Sun Pulse Indicator - this is set to * if sufficient sun pulses have been observed by the roll phase sensor.

B. Internal High Speed Index

1. The Master Tape number.
2. The number of the file on the Master Tape
3. The number of the sub-file in the file.
4. The number of the sub-file on the Master Tape.
5. Year number.
6. Day number.
7. Hour number.
8. Station number.
9. Stage/Buffer Tape number.
10. Start time of sub-file in hours, minutes and seconds.
11. Stop time of sub-file in hours, minutes and seconds.
12. Satellite Mode - 1 or 2.
13. Birmingham ON/OFF - 0 for off, 1 for on, with the possibility of two switches occurring during the sub-file, thus requiring three digits.
14. Iowa Mode - the indicator will have the same values as on the Master Tape. Again three digits will be required.
15. Jodrell Mode - as on Master Tape, one digit.
16. The date of the Master Tape generation as day, month, year.
17. Bad sub-file indicator. This will be set to 1 if a more recent (and better) version of the sub-file is available. It will have the value 2 if the sub-file is bad, but no other version exists. In either case the data should not be used.

18 - 24 Diagnostics produced by the SATAN program.

18. Number of parity errors.
19. Number of length errors.
20. Synch Errors.
21. Number of timing errors.
22. Percentage of 888's.
23. Percentage of values out of range.
24. [illegible]

C. Experimenters' Low Speed Index

1. The Master Tape number.
2. The number of the file on the Master Tape.
3. The number of the sub-file in the file.
4. The number of the sub-file on the Master Tape.
5. Year number.
6. Day number.
7. Hour number.
8. Station number.
9. Stage/Buffer Tape number.
10. Start time of sub-file in hours, minutes and seconds.
11. Stop time of sub-file in hours, minutes and seconds.
12. Birmingham ON/OFF.
13. Iowa Mode.
14. The date of the Master Tape generation as day, month, year.
15. Bad sub-file indicator. This will be set to 1 if a more recent (and better) version of the sub-file is available. It will have the value 2 if the sub-file is bad but no other version exists. In either case the data should not be used.
16. Time of equatorial crossing in degrees (15° to 1 hour), for compactness in writing. This indicates the first northbound crossing. If no equatorial crossing occurred during the sub-file the value 999 will be output.

D. Internal Low Speed Index

1. The Master Tape number.
2. The number of the file on the Master Tape.
3. The number of the sub-file in the file.
4. The number of the sub-file on the Master Tape.
5. Year number.
6. Day number.
7. Hour number.
8. Station number.
9. Stage/Buffer Tape number.
10. Command Time in hours, minutes and seconds.
11. Replayed Command Time in hours, minutes and seconds.
12. Birmingham ON/OFF.
13. Iowa Mode.
14. The date of the Master Tape generation as day, month, year.
15. Bad sub-file indicator. This will be set to 1 if a more recent (and better) version of the sub-file is available. It will have the value 2 if the sub-file is bad but no other version exists. In either case the data should not be used.

16 - 25 Diagnostics produced by the SATAN program.

16. Number of Parity Errors.
17. Number of length errors.
18. Synch errors.
19. Number of timing errors.
20. Percentage of 888's.
21. Percentage of values out of range.
22. Number of frames lost.
23. Command time.
24. End of replayed command time.
25. Average frequency.
