## **1. INTRODUCTION:**

The documentation for this data set was originally on paper, kept in NSSDC's Data Set Catalogs (DSCs). The paper documentation in the Data Set Catalogs have been made into digital images, and then collected into a single PDF file for each Data Set Catalog. The inventory information in these DSCs is current as of July 1, 2004. This inventory information is now no longer maintained in the DSCs, but is now managed in the inventory part of the NSSDC information system. The information existing in the DSCs is now not needed for locating the data files, but we did not remove that inventory information.

The offline tape datasets have now been migrated from the original magnetic tape to Archival Information Packages (AIP's).

A prior restoration may have been done on data sets, if a requestor of this data set has questions; they should send an inquiry to the request office to see if additional information exists.

## 2. ERRATA/CHANGE LOG:

NOTE: Changes are made in a text box, and will show up that way when displayed on screen with a PDF reader.

*When printing, special settings may be required to make the text box appear on the printed output.*

ISIS-1

ELECTRON DENSITY & TEMPRATURE

69-009A-07A

This data set has been restored. The original data was on a 9-track, 1600 BPI tape. The first file was written in EBCDIC, and the second file was written in ASCII. The restored DR tape is a 3480 cartridge and the DS tape is 9-track, 6250 BPI. Both files contain the same data. The first file is EBCDIC and the second file is an ASCII version of the first file. The DR and DS number along with the DD number and time spans are as follows:

DR#	DS#	DD#	FILES	TIME SPAN
DR002909	DS002909	DD013684	1	01/30/69 - 05/31/71
			2	01/30/69 - 05/31/71

ELECTRON DENSITY & TEMPERATURE

69-009A-07A

This data set consists of one Electron Density and Temp. tape. The tape was created on the Ibm 360 computer and is 1600 BPI, Ebcidic (the first file), and ASCII (the second file). Both files are identical. The time span is as follows:

<u>D#</u>	<u>C#</u>	<u>files</u>	<u>Time Span</u>
D-13684	C-11424	2	01/30/69-5/31/71

*Memorandum*

Lee Dubach, NSSDC

DATE: December 21, 1972

FROM L. H. Brace, ISIS-I Probe Investigator

SUBJECT: Qualification of ISIS-I electrostatic probe measurements

The ISIS-I probe measurements of electron temperature ( $T_e$ ) and concentration ( $N_e$ ) that we have submitted to the data center require a certain amount of qualification with regard to their accuracy. In this letter, which can be copied for the use of prospective data users, I will attempt to outline what we know about the accuracy of these measurements.

The goal of the computer analysis program was to evolve an automatic system that reflected an appropriate balance between measurement accuracy on one hand and economy of computer time on the other. The latter is necessary to permit a large fraction of the data to be analyzed given the limited amounts of computer time available for this analysis.

In the process of developing the program we found that the data base had a whole spectrum of data quality. Much of it consisted of nearly ideal volt-ampere curves that could be handled by a relatively simple program. However some of the raw data suffers from such problems as sounder-induced interference, ionospheric fine structure, photoemission from the spacecraft and in cases of very low electron density, positive spacecraft potentials. Since it is often necessary in correlative studies to provide measurements with whatever accuracy is possible, we have had to stretch our criteria for eligible curves rather extensively. As a result, it is sometimes possible for the analysis program to fail to get a value for  $T_e$  or  $N_e$ , or to get values that are in error. However we have reached a compromise program that can analyze a very large fraction of the data it encounters (> 90%) and will usually provide accuracies within 10% of the value that could be obtained with a more careful hand analysis.

The absolute values for  $T_e$  may be high by up to 10% because of experimental factors not easily corrected for and because of a tendency of the exponential fitting routine to fit too far up the curve, especially at temperatures below 2000°k. At higher  $T_e$ , more samples are available in the exponential region, and the accuracy improves.

The  $N_e$  values have been correlated with sounder-derived values, using the local plasma frequency, and are found to be systematically high by about 20-30%. This factor varies with satellite attitude and the value of  $N_e$  in a manner that has not been fully evaluated. If greater absolute accuracy is needed, I would suggest using the sounder-derived value.

In summary, then, it is important for users to note that all of the measurements are not equally good quality. If the user requires the greatest possible accuracy from a given set of data, it will be necessary to request us to scan the original data set to evaluate the accuracy or, alternatively, to reanalyze the data with a program that is more specific to that particular set of data. We will be happy to do that for limited amounts of data.
