4.0 UCSD/TRD DATA TAPES

The raw data tapes received at the laboratory are the EDR and EPH tapes, which are processed by our reduction program. The reduction program produces SUMMARY tapes which are described below, and BINARY REDUCTION tapes which contain each reading. The data are also fitted to a function of time and angle and the coefficients of this fit are given in the ANALYSIS tapes.

1. The twelve files are in the following order:

1	M1	1	703.716-704.532
2	M2	2	703.810-704.466

12	E3 - 1.12M1	6	703.716-704.532

2. The coefficients are connected to the data as follows:

Dead time corrected counting rate at time (T) = $CA(1) + CA(2)\ SIN\ \theta + CA(3)COS\ \theta$
$+ CA(4)\ SIN\ 2\theta + CA(5)COS\ 2\theta + CA(6)SIN\ 4\theta + CA(7)COS\ 4\theta$
$+ CA(8)(T-CT) + CA(9)(T-CT)^2 + error$

Where θ = azimuthal angle with respect to the closest approach to the direction of B.

And T = time in days + fraction, C T = time at which coefficients were calculated in cole days + fraction.

Day 703 on the Cole Calendar is December 3, 1973.

3. RMS error of square fit function with respect to data points.

4. Where data gaps exist, the number of data points per fit is reduced, resulting in a larger RMS error.

5. 2660 counts subtracted inbound, 3090 outbound, from channel E1 to account for power supply noise.

4.3 UCSD/TRD BINARY REDUCTION TAPES

The Binary Reduction Tapes (BRT's) are written in 7 track tape at 556 bits per inch by a CDC 3600 computer. All data are written as positive binary integers to facilitate decoding by different machines. (Padding and missing data are given negative values). The record length is 342 48-bit words, which is equivalent to 2736 six-bit characters.
