IMAGING DATA ON MAGNETIC TAPE

75-075A-01X

This data set catalog consists of 367 9-track, Binary, ~~1600~~ 6250 BPI, magnetic tapes. The tapes were created on the IBM 370 computer. The image numbers can be found in the following pages of documentation. The D and C numbers along with the ID numbers are as follows:

VIKING 1 ORBITER 75-075A-01X

The research described in this publication was carried out by the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration.

Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not constitute or imply its endorsement by the United States Government or the Jet Propulsion Laboratory, California Institute of Technology.

ABSTRACT

The Planetary Image Conversion Task group has processed 12,500 magnetic tapes containing raw imaging data from JPL planetary missions and produced an image data base in consistent format on 1200 fully packed 6250-bpi tapes. The output tapes will remain at JPL. A copy of the entire tape set has been produced and delivered to the U.S. Geological Survey (USGS), Flagstaff, Arizona. A secondary task converted computer catalogs (which had been stored in project specific MARK IV File Management System data types and structures) to flat-file, text format that is processable on any modern computer system.

The conversion processing took place at JPL's Image Processing Laboratory (IPL) on an IBM 370-158 with existing software modified slightly to meet the needs of the conversion task. The 12,500 input tapes were processed as a serial string of conversion jobs running an average of two shifts per day, five days a week for 12 months. Over 10,000 separate batch jobs were required and nearly 5000 hours of elapsed processing time (500 hours of CPU time). Approximately 4 person-years of labor were required, excluding computer operations support. The total conversion cost for this task equals $40 per input tape, or $5 per megabyte of data processed. Due to the nature of this task (fairly uniform, well-documented inputs, and minimal software development costs), these estimates should be considered as very optimistic in budgeting other restoration efforts.

More than 99 percent of the original digital image data was successfully recovered by the conversion task. However, processing data tapes recorded before 1975 was destructive. This discovery is of critical importance to facilities responsible for maintaining digital archives since normal periodic random sampling techniques would be unlikely to detect this phenomenon, and entire data sets could be wiped out in the act of generating seemingly positive sampling results.

It is recommended that immediate follow-on activities be initiated to: (1) develop a single, machine-independent utility program which will read images from any archive tape and perform simple fill-in of missing pixels and lines; (2) convert the Mariner 4, 6, and 7 image data and the Mariner 9 Master Data Records to high density format; (3) produce a vault copy of the Mariner 9 and 10 image archive tapes; and (4) document processed image data sets and calibration data files currently in storage.

ACKNOWLEDGMENTS

The authors wish to thank Nancy Evans (Planetary Data System Program Manager), Steve Saunders (Director, JPL Regional Planetary Image Facility), and Tom Duxbury (Supporting Research and Technology Manager, Information Systems Program) for their efforts to obtain NASA headquarters approval and funding for this task. Larry Soderblom, of the U.S. Geological Survey, Flagstaff, Arizona, provided assistance in designing the output data formats and evaluating archive images during processing. Steve Pelentay and John Baniqued of the IPL operations group were instrumental in obtaining hardware to support the conversion task and adjusting the IPL operations schedule to support conversion processing. Pam Kutsch, Valerie Nelson, and Ellen Wachner participated in a variety of task support activities. Darwin Brown handled tape logistics, data logging, and MTIS computer operations. Charles Avis and Glenn Garneau of the Space Image Processing Group provided all of the conversion software to support the task. Jody Swan and Linda Sowers of the U.S. Geological Survey (Flagstaff), and Sanjay Limaye (University of Wisconsin) were extremely helpful in tracking down alternate sources for missing images. Jancis Martin developed the catalog software used to produce the archive tape indexes included in this document. Harold Yamamoto of the Documentation Section assisted in the production of the final report.

I. INTRODUCTION

The goal of the Planetary Image Conversion Task Group was to rerecord JPL's digital archive of planetary images onto high-density magnetic tapes in consistent output format. This is probably the largest digital data restoration task carried out by NASA to date. This report describes the planning and execution of the task and provides a user's guide to the converted image archive. Because this task is recognized to be a precursor of other data restoration tasks, this report attempts to present what was learned by the conversion task staff to aid in planning and budgeting future activities, including deviations from initial processing plans and schedules.

The main section of this document includes a background and rationale for the task. It also gives an overview of the image data sets and historical storage and access procedures and describes how the conversion and data recovery processing were performed. Finally, a summary of the task results is provided, with recommendations for the disposition of tapes processed by the task and for additional work necessary to provide access to the new archive.

The appendixes contain descriptions of the new archive data set (VICAR Standard Format Experiment Data Records (Appendix A)); brief descriptions of imaging instruments, data records, and catalogs as reference material to archive tape users (Appendix B); conversion processing details including software descriptions and mission-by-mission processing notes (Appendix C); a summary of unrecovered data (Appendix D); and a complete index of image identifiers and archive tape and file numbers for all missions processed (Appendix E).

II. TASK BACKGROUND

Several major events led to the establishment of a conversion task group. A National Academy of Sciences report (Ref. 1) on space science data management awakened new interest in the fate of planetary data archives. The establishment of the Multimission Image Processing Laboratory (MIPL) moved JPL's image processing activities to a different host computer architecture (VAX systems rather than IBM mainframes) and complicated the processing of data and computer catalogs from the earlier missions. Finally, high-level attention was given to the data storage problem at JPL, caused by the overflow of the Federal Records Center, which housed the bulk of stored planetary data sets.

For more than a decade, the major stumbling block in the analysis of imaging data had been the 2- to 8-week delay between the submission of a user request for and receipt of specific data. While many factors contributed to this situation, the size of the archive (requiring storage remote from JPL) and diversity of EDR formats (requiring preliminary processing to produce an analyzable data set) were recognized as major problems. In this environment, proposals for restoration of the image data sets were developed and submitted first to the Information Systems office as an FY83 RTOP and later as a proposal to NASA code EL through JPL's Flight Project Support Office (FPSO). Ultimately, task management was funded by the Planetary Pilot, with task execution funded through FPSO.

III. IMAGE DATA DESCRIPTION

The image data set represents the most useful planetary data archive because the images are readily interpretable to support stand-alone geological and atmospheric analysis activities. They are also often required for the interpretation of measurements from other instrument types. The raw imaging data is the largest instrument data set produced by planetary missions to date. The 145,000 planetary images returned by the Mariner, Viking, and Voyager missions equate to more than 100 billion bytes of digital data and some 450 million individual telemetry records (mostly Viking Orbiter). Since the mid-70s, projects have grouped imaging telemetry records into more organized image files, greatly simplifying the task of indexing data sets and locating specific images.

Raw digital images are stored in the form of Experiment Data Records (EDRs) on standard 30.48-cm (12-in.) reels of magnetic tape. Unlike digital data records for other experiments, the imaging EDRs are not delivered to the experiment team, but rather to the Image Processing Laboratory at JPL, where they are available for specialized second-order processing to support detailed science analysis. Copies of EDRs are also routinely provided to the USGS in Flagstaff and imaging team investigators at other institutions. In general, EDR data consist of unprocessed (raw) instrument data in mission-dependent formats. For the Mariner missions, the EDR simply represents a subset of imaging and engineering records from the telemetry Master Data Record (MDR). For the Viking Orbiter mission, substantial processing was required to reconstruct each image owing to the unique manner in which data were transmitted to Earth (described in Appendix B). For the Viking Lander data set, the EDRs were produced at the IPL and are stored on tape in VICAR format. Imaging data tapes taken from the Mariner 4, 6, and 7 missions consist of processed VICAR format images produced by IPL.

Numerous enhanced "second-order" image files exist for all missions. These files are not considered formal data records but represent an enormous investment in computer processing. In addition, files required for certain types of image processing (i.e., radiometric calibration files) have been produced and maintained by IPL analysts but are not formally documented. These data sets were not addressed by this task.

The responsibility for maintaining this archive and providing access to the digital data has not been clearly defined. While the National Space Science Data Center (NSSDC) receives reduced data sets in digital form from other space science instruments for dispersal to the scientific community, it has never had the resources to receive or maintain the digital images. JPL's Image Processing Laboratory and Regional Planetary Image Facility (RPIF) have informally maintained image catalogs and provided user access to digital images on a no-charge, level-of-effort basis. The tapes are stored in boxes, in a climate controlled environment, at the Federal Records Center at Laguna Niguel, California. To access an individual tape, the entire box must be recalled. This procedure takes from 2 to 8 weeks.

The accepted industry practices for long-term magnetic tape maintenance (such as periodic cleaning and rewinding) never have been performed on any of

JPL's data archives. Periodic sampling (every several years) and occasional processing of images from earlier missions to support user requests have generally been successful. This approach to testing tends to disguise a problem that was uncovered during the execution of this task, namely, the older tapes are readable once with very few errors, but this initial processing tends to damage the tapes and makes them unreadable for later processing.

IV. CONVERSION AND DATA RECOVERY PROCESSING

The conversion effort as actually performed differs from the original proposals. The initial plan called for the development of new software to process the EDRs and produce data sets that would be compatible with NASA standard data formats (SFDUs), which were then being developed. These data sets would carry a consistent set of secondary and tertiary labels specifically designed for imaging experiments. The processing software would also interact with a data management system to build an archive data catalog as the processing was performed. The IPL IBM 370/158 would be used to perform the processing based on resource availability and a charging scheme which reduced costs for tape mounts and I/O, the major resources required for the task. Two 6250-bpi tape drives would be leased and installed on the IPL computer system to allow two processing jobs to run simultaneously for increased throughput.

Due to the limited funding available for the conversion effort, several changes to the original plans were made. It became apparent that the development of new software to process the EDRs was unrealistic. Instead, existing logging programs were modified to produce mission-dependent, but consistent, output image files. Plans to have the processing software interact with a data management system to document processing results were revised. Thus, the software would output processing summaries to "journal" files, which would then be processed using the MARK IV file management system to produce summary catalogs.

During planning it was noted that the first MIPL VAX would be available at about the same time that processing began. This computer would have four tri-density (800, 1600, and 6250) bpi drives, but would be largely unused other than during the prime shift. It was decided to lease only a single 6250-bpi tape drive for the IBM and use that system to process the Mariner images (which required 7-track drives that are only available on that machine) and attempt to process as much of the Viking and Voyager data sets as possible on the MIPL system during the off-hours. In fact, due to numerous difficulties in the development of the MIPL tape input/output software, working conversion programs were never produced, and the MIPL computers were used only for the duplication of archive tapes for delivery to Flagstaff. This procedure caused the conversion processing to be stretched out over a longer period of time than originally planned (12 months versus 6 months). A secondary cause of delay in processing was due to the emergence of a large Galileo-related task which required substantial IBM computer utilization and reduced the resources available to the conversion task.

A duplicate copy of the archive was produced for delivery to USGS, Flagstaff. The duplicate copy provides a verification of the readability of

all tapes produced, physical dispersal of the archive in the event of a large-scale disaster, and a backup source if an archive tape is damaged during future processing. There is now some sentiment for production of another copy so that one data set can be stored in a vault as an archive, while the other two sets are used as working copies at JPL and Flagstaff.

A substantial deviation from planned processing was the inability to successfully process multiple jobs at the same time. It was found that channel contention problems reduced throughput to a level where two jobs running simultaneously ran twice as slow as one job at a time, thus not increasing throughput at all while complicating job submittal and execution procedures and increasing the chances for operator error. System modifications to reduce channel contention improved operations somewhat, but the ultimate processing flow consisted of a serial string of conversion jobs running two shifts per day (swing and midnight), 5 days a week. Single shifts on weekends were often used, staffed by conversion task personnel or operators working overtime. A flowchart summarizing the conversion processing effort is shown in Figure 1. Appendix C describes the procedures for conversion processing, provides processing notes for each mission data set, and describes the software used for the conversion and cataloging tasks.

The conversion task required substantial computer and workforce resources. Table 1 provides monthly summaries of computer utilization, including the number of batch jobs executed ("Nbr/Jobs"), Terminal Sessions ("Term Sess") to set up the batch job command files, elapsed (wall clock) and CPU time in hours on the IBM 370/158, and the total computer charges for these resources. Table 2 identifies total costs for major resource categories. The material in Table 3, Workforce Utilization, breaks down the efforts of the conversion staff by category of effort. Appendix C presents notes related to the processing of each data set.

Errors in processing had a number of potential causes, with a variety of possible actions required for recovery. The conversion task experienced hardware errors and operator errors which had nothing to do with the quality of data being processed (although this was not always obvious). Temporary input/output errors on tapes could be resolved by reprocessing. Permanent input/output errors or physically damaged tapes required processing of an alternate data source for recovery. Alternate sources included copies of equivalent EDRs from other facilities (for the most part USGS, Flagstaff) and master data records from which new EDRs could be regenerated and processed by the conversion software. A great deal of support was provided by USGS, including shipment of many hundreds of EDR tapes to JPL to support the recovery effort.

It was not possible to exhaustively document all errors encountered in the conversion processing. A subset of tapes processed has been analyzed to produce the information in Table 4, which shows the file location of physical errors on about 7000 input tapes. For the Viking Orbiter tapes, the average reel contains 10 files (70% full) and for Voyager, 24 files (90% full). In general, the errors reported in Table 4 cause the loss of a single EDR line record. For the most part, only a single error was found on any tape, but 17 Viking Orbiter EDRs and 9 Voyager EDRs did have multiple errors.

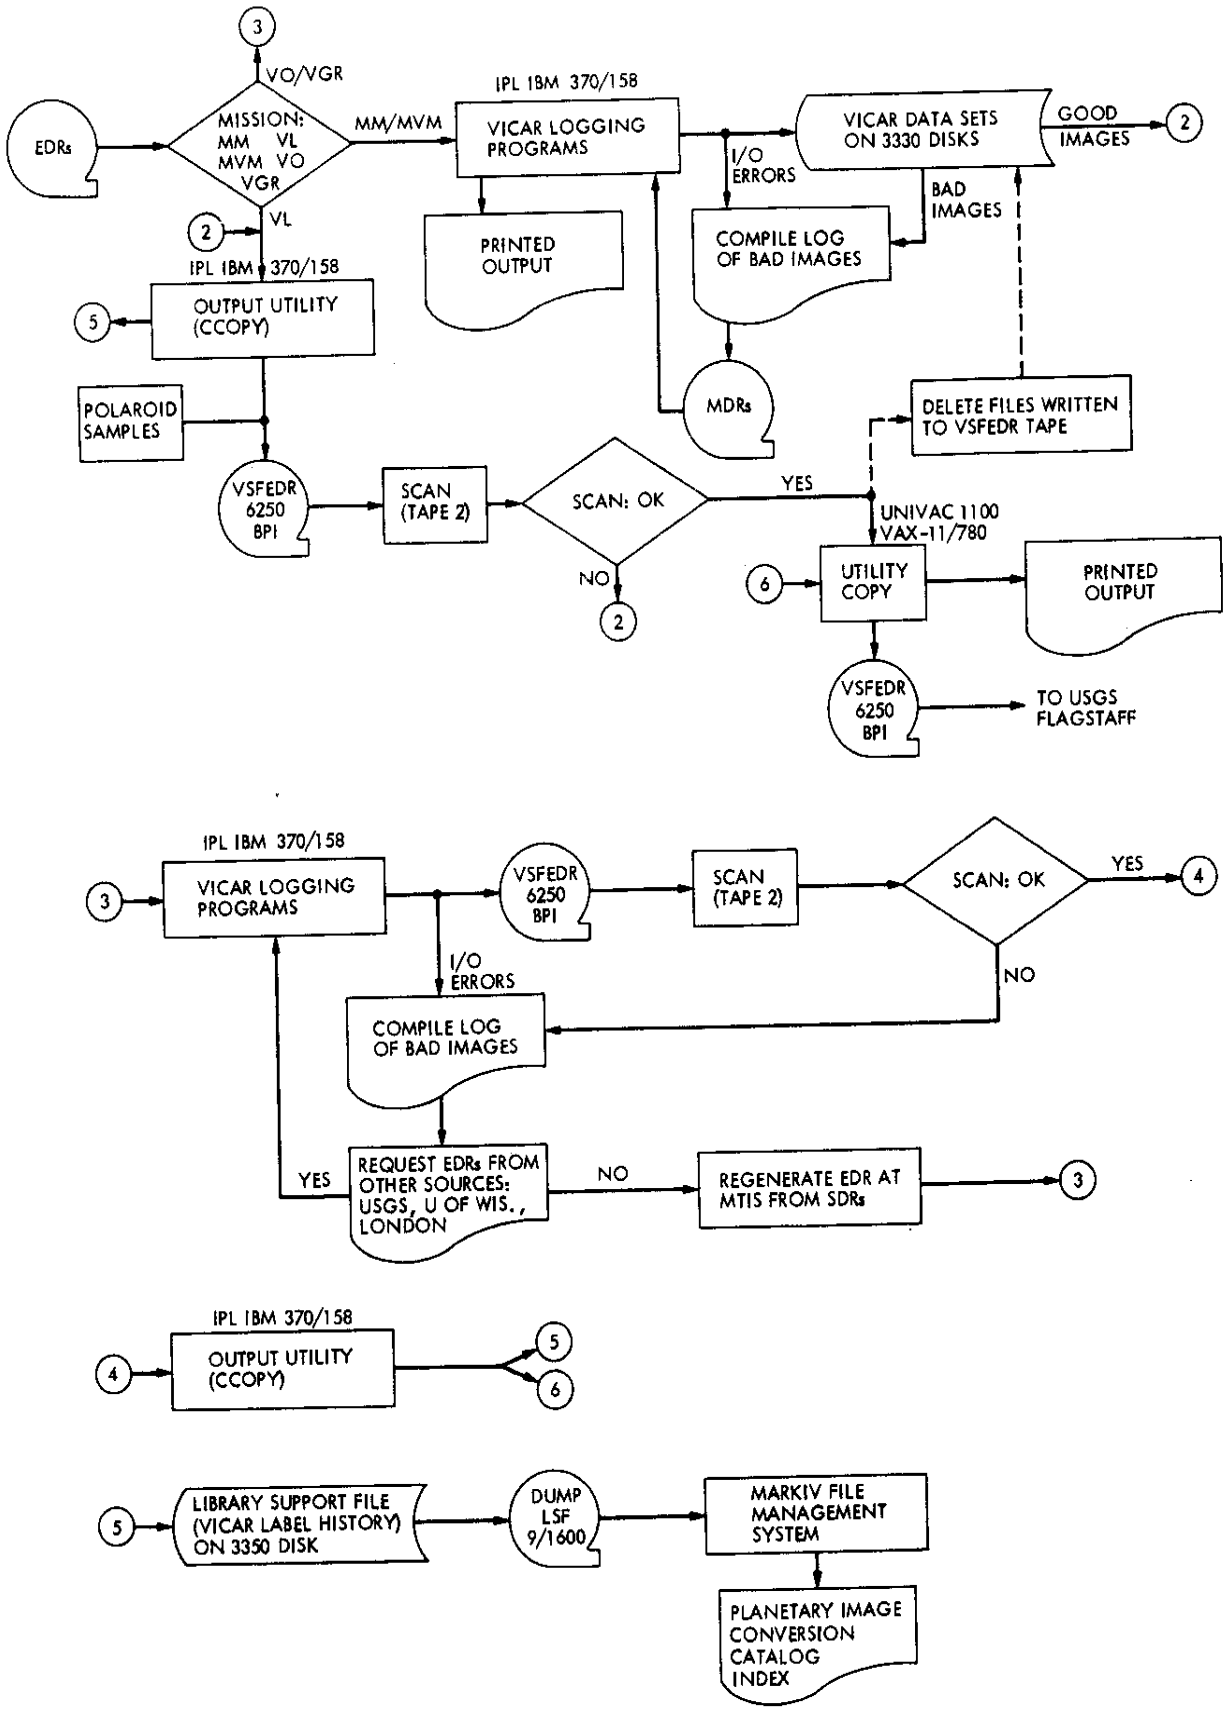

Figure 1. Image Data Conversion Processing Flow

Table 1. Conversion Processing Statistics

	1983							1984				
	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun

Table 2. Resource Requirements

Resource	Amount
Total elapsed time	4833 hours
Total CPU time	536 hours
Total computer charges	172,000 dollars
Total tapes required	2500 reels
Total tape cost	50,000 dollars
Total labor months	48 work months
Total budget	459,000 dollars

Errors categorized by tape age are as follows (in groups representing about 1000 tapes each):

Year written	1976	1977	1978	1979
Errors	59	48	48	24

It is significant that most errors were encountered in the first several hundred feet of tape, which could possibly be related to edge damage from handling or from winding tensions. The reliability figures look very good for tapes from all missions. An attempt to correlate tape errors with specific vendors was inconclusive.

In order to regenerate Viking EDRs, the MTIS processing system had to be de-mothballed and brought to a working state. This activity was not overly successful due to a long delay in making the system operational and numerous

hardware problems caused by the age and condition of the equipment. Ultimately, only images that were totally unrecoverable by any other means were regenerated on the MTIS system. Efforts to regenerate degraded images produced results that were also degraded. At best only a handful of lines could be successfully recovered at the expense of hours of processing time. In retrospect, it was concluded that data salvage activities that rely on the use of ancient or highly specialized hardware systems should be avoided.

V. RESULTS AND RECOMMENDATIONS

This section provides an evaluation of the task as performed, liens in terms of unprocessed or unrecovered data, and recommendations regarding the

disposition of EDR and MDR tapes processed by the conversion task group. Suggestions for future work are presented, including the development of uniform archive tape processing software, production of a backup or vault copy of the archive tapes, and salvage/conversion of image calibration data as well as processed image data from earlier missions.

A. Unprocessed or Unrecovered Data

A summary of unrecoverable images from all missions is provided in Appendix D. The formats of imaging tapes from the earliest Mariner missions (4, 6, and 7) representing about 220 images could not be determined within the resources of the conversion task. These tapes have been identified and collected but not yet processed for fear of destroying their data contents. All information collected on these tapes is provided in Appendix B. A follow-on effort is needed to complete this research activity and convert the data to high-density tape.

Based on our attempts to recover certain Viking Orbiter images, it was realized that the processing of MDR tapes using the MTIS system may require a number of years with no certainty of success. In this case the MDR tapes will be retained in the event that a user might find it absolutely essential to recover missing lines and pixels.

Due to the limited availability of resources at institutions that might provide copies of missing Voyager data (particularly the University of Wisconsin and Imperial College, London), it is expected that such copies will continue to be received at JPL over a period of several years. Continued funding will be required to add these data to the archive. This support should be explicitly identified as a Planetary Data System salvage/support task.

Digital data sets from non-JPL missions (including Pioneers 10 and 11 and Pioneer Venus Orbiter) should be identified and added to the archive collection at some point in the future.

B. Disposition of EDRs and MDRs

Disposition of the 12,000 input EDR tapes after the data conversion activity was not addressed in the initial plans for the task. It was assumed that some of them could be reused to support other projects or distributed to other centers which require imaging data for continuing analysis support. Up to this point requests for two sets of data have been received. Washington University in St. Louis has requested the Viking Orbiter Survey mission EDRs (1000 tapes on a long-term loan basis), and the University of Wisconsin has requested certain Mariner 9 RDR tapes even though this data set could not be processed due to I/O errors. It is known that the EDRs from Mariners 9 and 10 are of little use either for rereading or rerecording due to degradation from aging. Unless requested by some NASA facility, they should probably be destroyed. The Viking and Voyager tapes could be effectively reused in non-critical applications; however, these data sets are too useful in supporting ongoing science analyses at other institutions to be erased. It is recommended that they be transferred to institutions willing to accept and utilize them for image analysis.

The Master Data Records (MDRs) from all JPL missions except Viking Orbiter contain both the imaging telemetry records and the non-imaging science and engineering data. A proposal for the restoration of these data sets has been tentatively approved and will be carried out during 1985 and 1986. The Viking Orbiter mission produced a science/engineering MDR as well as an imaging MDR data set. The imaging MDR consists of about 12,000 tapes that can probably be considered obsolete, now that the image conversion task is complete. Due to the peculiar format of the imaging data, only a specialized processing system such as the MTIS can be used to reconstruct the images. Once MTIS is gone, these tapes can be reused for other applications.

Any decisions regarding the fate of these data sets should be made with the concurrence of JPL and NASA management, including planetary discipline chiefs at NASA Headquarters, as well as approval by the major imaging investigators. Since the Voyager mission is still active, decisions regarding its tapes should be approved by project management.

C. Uniform Processing Software

This task was concerned with saving the planetary image data sets and did not address their ultimate use by the JPL/MIPL user community or by outside scientists. It would be helpful if MIPL could be commissioned to develop a portable image reader program in FORTRAN for use within the MIPL and for distribution to users of archive tapes. This code would allow conversion of the EBCDIC VICAR labels to any of several commonly used header label formats (ASCII VICAR, VICAR2, etc.), and the interpretation or removal of engineering parameters appended to each image line as well as the header record information stored at the tail of each VSFEDR image file for the Viking and Voyager missions. The ability to perform cosmetic processing on the raw image data (missing line and pixel fill-in operations) should also be provided.

D. Archive Backup Copy

Due to the destructive effect of processing Mariner 9 and Mariner 10 EDR tapes, the only existing copies of these data sets are the two VSFEDR copies. Since both of these sets are considered to be working copies, it is imperative that a vault copy of these tapes be produced, which will not be used except to produce new working copies of archive tapes. The Viking and Voyager archive tapes are backed up by readable sets of EDRs at JPL and Flagstaff. It has been proposed that these tapes be backed up in a gradual manner through the production of an archive tape copy whenever images from an archive tape are requested by users. Consideration should be given to a system where requestors of digital images are required to submit two blank tapes for each request, one to write their images on, and one to produce an archive tape backup.

E. Processed Data Files

More than 10,000 tapes of IPL-processed images from missions dating back to Mariner 9 are stored at the Federal Records Center. For Voyager and Viking, many of these processed data sets are far more valuable than the raw

EDRs. A recovery effort similar in magnitude to this task needs to be initiated. However, it is not likely that these tape data sets will be subject to degradation in the next several years. They will become more difficult to identify and document as the IPL analysts who produced them leave JPL.

F. Calibration Data Sets

Several efforts have been proposed to locate and recover the calibration data files needed to radiometrically correct images from past missions. This activity should have a high priority because the data sets from Mariners 9 and 10 are in danger of becoming unreadable.

G. Hindsight

The task would have benefitted from having at least one additional full time person to support documentation of processing, tracking down errors, assuring the validity of all processed data and summaries, and producing a more comprehensive final catalog.

Without accurate catalogs of existing or expected data, it was difficult to determine when all possible data was recovered. Thus, extra research, sometimes fruitless, was required. Obtaining data from other institutions proved to be very time consuming. Funds to support at least the out-of-pocket expenses involved in data acquisition from other institutions should have been budgeted. Regenerating missing data was an order of magnitude more time consuming than normal processing operations. Where hardware had to be retrieved from storage (MTIS system), it was found that documentation and operational procedures had been lost and re-assembly/testing took many months of trial and error effort. This was with a system that had been mothballed with some expectation of being used in the future.

The handling of large numbers of tapes requires careful planning of timing and tape logistics, as well as a large storage area for preliminary sorting and a staging area in close proximity to the computer system to support actual processing. If adequate space is not available, it is at the expense of extra packing/unpacking and more complex operational procedures.

APPENDIX A

ARCHIVE TAPE (VSFEDR) FORMAT DESCRIPTION

1. ARCHIVE TAPE FORMAT

The converted images are stored in a "uniform" output format, called VICAR standard format experiment data record (VSFEDR). The VICAR (Video Image Communication and Retrieval) format was developed within JPL's Image Processing Laboratory and has been used for almost two decades to allow simplified access to and processing of digital images. It also provides the capability to store supplementary information (image identification, location, and characteristics) as well as processing information (audit trail) in conjunction with the digital image itself.

The basic archive tape (VSFEDR) format is as follows:

(1) VICAR standard header label.
(2) Mission-dependent VICAR labels.
(3) Digital image lines.
(4) Engineering data appended to each line.
(5) Mission-dependent EDR header record (Viking and Voyager only).

The efficient utilization of magnetic tape for data storage requires "blocking" of logical records into physical records to reduce the overhead required for interrecord gaps. In producing the archive tapes a blocksize approaching 32K bytes was used, which corresponds to the largest generally used I/O buffer area on modern computer systems. Because of the variable format of Viking Lander images, records were not blocked. Reference Table A-1 for VSFEDR tape physical characteristics by mission. Figures A-1 through A-5 illustrate the archive tape format for each mission.

Table A-1. Archive Image (VSFEDR) Formats

Mission	Logical Record Length	Physical Record Length	Physical Records in File	Lines per Image	Pixels per Line	Engineering Bytes
Voyager	1,280	32,000	33	800	800	480
Viking Orbiter	1,600	32,000	53	1056	1204	396
Viking Lander	9,000*	9,000*	*	512	*	n/a
Mariner 10	968	31,944	22	700	832	136
Mariner 9	968	31,944	22	700	832	136

* Variable, minimum record length = 360, maximum = 9000.

Figure A-4. Mariner 10 Image File Format

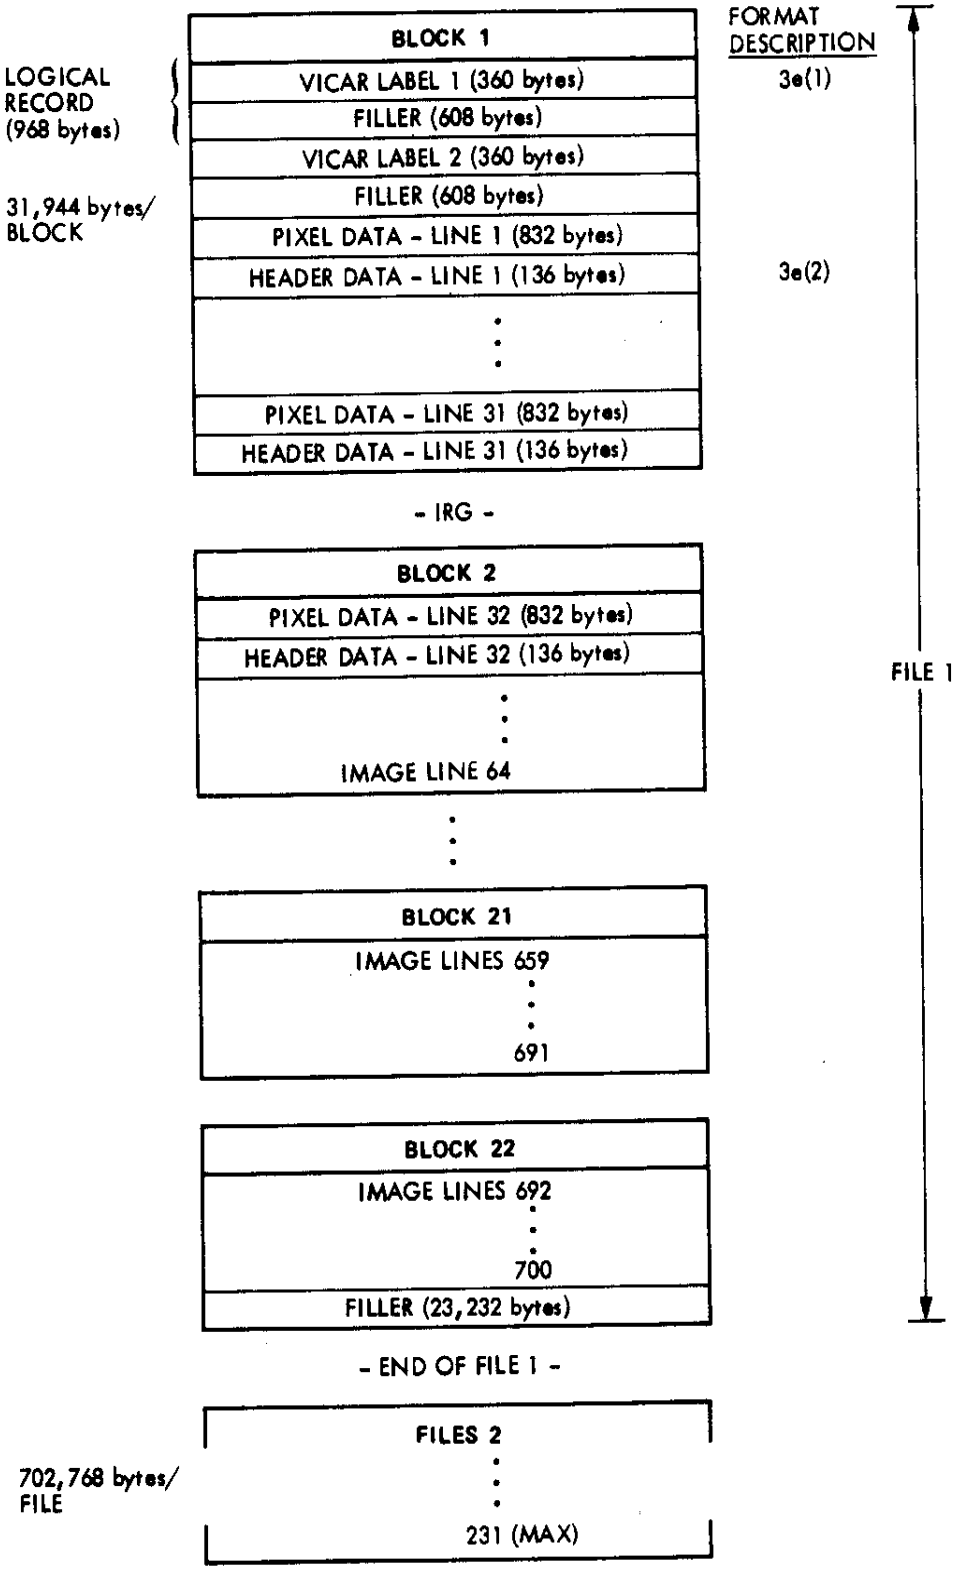

Figure A-5. Mariner 9 Image File Format

The VICAR format image is produced from a project EDR or MDR by executing a "logging" program. The logging programs were developed separately for each mission to handle the particular idiosyncrasies of project data record formats. Basic logging program functions are to construct a VICAR label set for the output file, read the project EDR and strip out just the image pixel data, write out the VICAR image file, and report on the success of these activities to the user. In producing the VICAR format image certain header data and engineering telemetry parameters carried by the EDR are eliminated. This was not considered acceptable for the development of the VSFEDR archive so the logging programs had to be modified to retain all EDR data. This was done by moving all engineering header data associated with an image line to the tail of the image data within a single logical line record. Project header records were stored in a buffer and inserted in the VSF output file after the last line record. Thus, all engineering parameters are retained, but may be conveniently ignored by the user when the image file is read.

2. VICAR LABEL FORMAT

VICAR labels are stored in character string format, appearing as 72 byte records, normally grouped into 360 character blocks, each containing 5 or less label records. The first record, a VICAR header record, defines the image data format and size. A variable number of application dependent label records follow, terminated by a label record containing a character "L" in byte 72. Like the imaging EDR formats, the VICAR label records used by IPL vary from mission to mission. In general the image id comes first, followed by engineering parameters defining the camera state and a subset of SEDR parameters including the image footprint latitude and longitudes, and other useful interpretive parameters (picture size, range to target, lighting and viewing conditions).

The VICAR standard system label precedes each set of mission specific labels. The format adopted in 1977 is as follows:

(all characters represented in EBCDIC format)

Byte 1 to 2	- Characters "77" or blank
Byte 17 to 24	- Number of lines in image or blank.
Byte 25 to 32	- Number of samples in image or blank.
Byte 33 to 36	- Number of lines in image.
Byte 37 to 40	- Number of samples per line.
Byte 41 to 42	- Pixel code - "L" or "I" for binary integer.
Byte 43 to 44	- Bytes per sample (1).
Byte 71	- Label identification (not always present).
Byte 72	- Character "C" indicating more labels follow, or "L" to indicate the last label.

Formats for additional VICAR labels are shown below. Note that the number of lines for Viking Orbiter and Voyager images includes an extra line which is actually the MTIS EDR header label, appended after the last actual image line in a file. The number of samples includes any engineering telemetry bytes appended at the end of the actual pixel values for the line. Most users can ignore these extra lines and samples in processing archive image files.

Viking Orbiter, Mariner 10, and Mariner 9 labels are always identical. Viking Lander labels may vary due to the list of missing lines at the end of the label set. A great number of images do not have SEDR values in the positions allocated for them in the VICAR label format. Even when values appear, they can not be guaranteed to contain valid data values. For accurate SEDR data the mission specific SEDR or picture catalog should be used.

3. ARCHIVE FILE CONTENTS BY MISSION

This section describes the labels and engineering parameters included in the archive tape format for each mission data set. The VICAR header labels for each mission are presented first, followed by a description of the engineering parameters contained in EDR image file header records, and those associated with each image line.

a. Voyager File Format

Each Voyager image file consists of 33 blocks containing 32,000 bytes per block. Each block is composed of 25 logical records of 1280 bytes each. The first three logical records of the first block contain 3 sets of VICAR label information. The labels are followed by 800 logical records (one per image line) containing pixel data and engineering data. A 1280-byte MTIS EDR header record follows the last line record of the image. The data contents of the labels, engineering data, and header record are provided below. Definitions for the parameters in the header records were taken from JPL document 618-792 (Ref. A-1).

1) Voyager VICAR Labels

```

2) Voyager Line Header Data

The Voyager MTIS EDR line header contains 220 bytes of data. It consists of a 116-byte MTIS header block, 76-byte source data summary, and 28-byte status/engineering block. Byte locations are given relative to the start of the header block, which would actually be byte 801 of the VSFEDR line record.

Byte			Contents
MTIS Header Block:			
1	-	2	Record id (8 bits), unused (8 bits).
3	-	4	Physical sequence number on tape.
5	-	6	Logical sequence number on tape.
7	-	8	ERT year of century (7 bits), day of year (9 bits).
9	-	10	ERT minute of day (11 bits).
11	-	12	ERT milliseconds of minute.
13	-	18	Unused.
19	-	20	FDS mod 16 count.
21	-	22	FDS mod 60 count.
23	-	24	FDS line count.
25	-	36	Unused.
37	-	68	MTIS physical recording words 1 to 16 (16 bits each).
69	-	70	GCF sync code (MSB).
71			GCF sync code (LSB).
72			Source code.
73			Destination code.
74			Block format code.
75	-	76	GDD (3 bits), UDT code (7 bits), DDT code (6 bits).
77	-	78	"0", Spacecraft number (7 bits), time (MSB).
79	-	80	Time (LSB).
81	-	82	Unused (2 bits), day of year (12 bits), block serial number MSB (2 bits).
83			LSB of block serial number.
84			Millisecond clock.
85			Serial number.
86			GCF configuration status.
87	-	88	Unused (13 bits), esc (2 bits), unused (1 bit).
89	-	116	Unused.
Source Data Summary Block:			
117	-	118	Line number.
119	-	120	Format id.
121	-	122	Bit signal-to-noise ratio.
123	-	124	Unused.
125	-	126	Symbol synchronizer signal-to-noise ratio.
127	-	128	Unused.
129	-	130	AGC.
131	-	132	Unused.

133	-	134	Number of sync code errors.
135	-	136	Number of FDS count errors.
137	-	138	Unused.
139	-	140	Allowed number of sync code errors.
141	-	142	Allowed number of FDS count errors.
143	-	144	Number of minor frames.
145	-	146	Number of full minor frames.
147	-	148	Number of partial minor frames.
149	-	150	Number of mission minor frames.

The following ten 16-bit words contain the sync status in bits 1 and 2:

151	-	170	Number of frame id errors MF #1 through MF #10.
171	-	190	Number of bits retained MF #1 through MF #10.
191			Input source.
192			Input type.

Status/Engineering Block:

193	-	212	Imaging science subsystem status/engineering word MF #1 through MF #10.
213	-	216	Unused.
217	-	218	First valid pixel id.
219	-	220	Last valid pixel id.

3) Voyager MTIS EDR Header Block

This block occurs after the last VSFEDR line record in each image file. It is composed of a 116-byte MTIS header block, 76-byte source data summary, 56-byte status/engineering summary, and 1024-byte source data histogram.

Byte			Contents
MTIS Header Block:			
1			Record id.
2			File number.
3	-	4	Physical sequence number on tape.
5	-	6	Logical sequence number on tape.
7	-	8	ERT year of century (7 bits), day of year (9 bits).
9	-	10	ERT minute of day (11 bits).
11	-	12	ERT milliseconds of minute.
13	-	14	ERT year of century (7 bits), day of year (9 bits).
15	-	16	ERT minute of day (11 bits).
17	-	18	ERT milliseconds of minute.
19	-	20	FDS mod 16 count.
21	-	22	FDS mod 60 count.
23	-	24	FDS line count.
25	-	26	FDS mod 16 count.

27	-	28	FDS mod 60 count.
29	-	30	FDS line count.
31	-	32	SCET year of century (7 bits), day of year (9 bits).
33	-	34	SCET minutes of day.
35	-	36	SCET milliseconds of minute.
37	-	68	MTIS physical recording words 1 to 16 (16 bits each).

GCF Parameters for First Line Record:

69	-	70	GCF sync code (MSB).
71			GCF sync code (LSB).
72			Source code.
73			Destination code.
74			Block format code.
75	-	76	GDD (3 bits), UDT code (7 bits), DDT code (6 bits).
77	-	78	"0", Spacecraft number (7 bits), time (MSB).
79	-	80	Time (LSB).
81	-	82	Unused (2 bits), day of year (12 bits), block serial number MSB (2 bits).
83			LSB of block serial number.
84			Millisecond clock.
85			Serial number.
86			GCF configuration status.
87	-	88	Unused (13 bits), esc (2 bits), unused (1 bit).

GCF Parameters for Last Line Record:

89	-	90	GCF sync code (MSB).
91			GCF sync code (LSB).
92			Source code.
93			Destination code.
94			Block format code.
95	-	96	GDD (3 bits), UDT code (7 bits), DDT code (6 bits).
97	-	98	"0", Spacecraft number (7 bits), time (MSB).
99	-	100	Time (LSB).
101	-	102	Unused (2 bits), day of year (12 bits), block serial number MSB (2 bits).
103			LSB of block serial number.
104			Millisecond clock.
105			Serial number.
106			GCF configuration status.
107	-	108	Unused (13 bits), esc (2 bits), unused (1 bit).
109	-	116	Unused.

Source Data Summary Block:

117	-	118	Unused.
119	-	120	Format id.
121	-	122	Bit signal-to-noise ratio minimum.
123	-	124	Bit signal-to-noise ratio maximum.
125	-	126	Symbol synchronizer signal-to-noise ratio minimum.
127	-	128	Symbol synchronizer signal-to-noise ratio maximum.
129	-	130	AGC minimum.

131	-	132	AGC maximum.
133	-	134	Number of sync code errors.
135	-	136	Number of FDS count errors.
137	-	138	Sync parameters.
139	-	140	Allowed number of sync code errors.
141	-	142	Allowed number of FDS count errors.
143	-	144	Number of lines.
145	-	146	Number of full lines.
147	-	148	Number of partial lines.
149	-	150	Number of unreadable records.
151	-	152	Number of logical sequence breaks.
153	-	160	Sort parameter 1 thru 4 (16 bits each).
161	-	162	Number of minor frames from IDR.
163	-	164	Number of minor frames from WBDL.
165	-	166	Number of minor frames from SDR.
167	-	168	Number of missing minor frames.
169	-	170	Unused.
171	-	180	Picno (picture count, target, spacecraft, day).
181	-	190	Unused.
191			Input source.
192			Input type.

Status/Engineering Data:

193	-	194	Shuttered picture indicator.
195	-	196	Slow scan status.
197	-	198	Exposure time, filter, elec cal.
199	-	200	Picture count.
201	-	220	Parameter A through D values, 3 16-bit values each, representing a present value, word indicator and word pointer.
221	-	230	Ten 8-bit analog samples with the 8 MSB of each word representing the narrow-angle camera sample and the 8 LSB representing the wide-angle camera.
231	-	232	Pixel average, command status.
233	-	242	ISS engineering measurements.
243	-	248	Unused.

Source Data Histogram:

249	-	252	Number of pixels with value 0 (32 bits).
253			Number of pixels with value 1 ... 254.
1269	-	1272	Number of pixels with value 255 (32 bits).
1273	-	1274	Unused.
1275	-	1276	FDS mod 16 count.
1277	-	1278	FDS mod 64 count.

b. Viking Orbiter File Format

Each Viking Orbiter image file consists of 53 blocks containing 32,000 bytes per block. Each block is composed of 20 logical records of 1600 bytes each. The first two logical records of the first block contain 2 sets of VICAR label information. The labels are followed by 1056 logical records

(one per image line) containing pixel data and engineering data. A 1200-byte MTIS EDR header record follows the last line record of the image. The data contents of the labels, engineering data, and header record are provided below. Definitions for the engineering parameters in the header records are taken from JPL document 620-319 (Ref. A-2).

1) Viking Orbiter VICAR Labels

```
77                                  10571600 L 1                                C

2) Viking Orbiter Line Header Parameters

The Viking Orbiter EDR line record header contains 396 bytes of data. It is composed of a 32-byte MTIS header, 56-byte source data summary, seven 32-byte SDR header records (one per track), and seven 12-byte V1280 flyback blocks. Locations are given relative to the start of the header block which is actually at byte 1205 of the line record.

Byte			Contents
MTIS Header Block:			
1	-	1	Record id.
2			Unused
3	-	4	Recording sequence number on EDR tape.
5	-	6	Logical sequence number on EDR file.
7			Year of century of start of data.
8			Day of year of start of data.
9	-	10	Minutes of day of start of data (10 bits).
11	-	12	Milliseconds of minute of start of data.
13			Year of century of end of data.
14			Day of year of end of data.
15	-	16	Minutes of day of end of data (10 bits).
17	-	18	Milliseconds of minute of start of data.
19	-	22	FDS time of start of data.
23	-	26	FDS time of end of data.
27	-	32	EDR tape id (ASCII).

Source Data Summary Block:

33			Unused.
34			File number on EDR tape.
35			Fill in type.
36			Track presence mask.
37	-	38	Average pixel value.
39	-	40	Unused.
41	-	42	Data Receipt Site Mask.
43	-	44	Minimum signal-to-noise ratio (SNR).
45	-	46	Maximum signal-to-noise ratio (SNR).
47	-	48	Unused.
49	-	50	Minimum average gain control (AGC).
51	-	52	Maximum average gain control (AGC).
53	-	54	Unused.
55	-	56	Total number of segments.
57	-	58	Number of fully synched segments.
59	-	60	Number of partially synched segments.
61	-	62	Number of segments with data quality ind = 0.
63	-	64	Number of segments with data quality ind = 1.
65	-	66	Number of segments with data quality ind = 2.
67	-	68	Number of segments with data quality ind = 3.
69	-	70	Number of segments with data quality ind = 4.
71	-	72	Number of corrected FDS counts.
73	-	74	Number of pseudonoise code (pn) errors.
75	-	88	Unused.

SDR Data Blocks. The following data block repeats for each of the seven sets of line segments used to generate the image. Data locations are shown for the first segment. Locations for succeeding segments are at loc + ((segment-1) * 32).

89	-	90	Data quality indicator (3 bits), rate code (3 bits), revision number (10 bits).
91	-	92	MSB of average gain control (? bits), bit sync flag (1 bit), be (1 bit), unused (? bits).
93	-	94	LSB of average gain control (4 bits), signal-to-noise ratio (12 bits).
95	-	96	Lock count (number of continuously locked telem frames).
97	-	98	MSB of FDS count (? bits).
99	-	100	LSB of FDS count (? bits).
101	-	102	TD PF (? bits), track number (? bits), line number (? bits).
103	-	104	DSS station id (8 bits), milliseconds of minute (8 bits).
105	-	106	GCF UTD (? bits), day of year (? bits).
107	-	108	SC(1) (1 bit), DSIF lock status (? bits), MSB of seconds of minute (? bits).
109	-	110	GCF DDT (8 bits), LSB of seconds of minute (? bits).
111	-	112	SC(2) (? bits), DSIF configuration code (? bits).
113	-	114	Sync error (? bits), data bit count (? bits).
115	-	116	DP (1 bit), unused (1 bit), HEW index (? bits), housekeeping engineering word (? bits).

117	-	118	DP (1 bit), unused (1 bit), SEW index (? bits), science engineering word (? bits).
119	-	120	Unused.

V1280 Flyback Block. This block repeats 7 times, one for each set of line segments used to construct the line. The location of data values in segments 2 - 7 is loc + ((track -1) * 12).

313	-	314	Unused (2 bits), MSB of sync word (14 bits).
315	-	316	LSB of sync word (14 bits), MSB of track id (1 bit).
317	-	318	LSB of track id (2 bits), engineering data (5 bits), MSB of picture id (9 bits).
319	-	320	LSB of picture id (10 bits), MSB of line id (6 bits).
321	-	322	LSB of line id (5 bits), FDS flag (1 bit), HRD (1 bit), embedded science data (5 bits), unused (4 bits).
323	-	324	Unused.

3) Viking Orbiter EDR Header Record Format

This block occurs after the last VSFEDR line record in each image file. It is composed of a 32-byte MTIS header block, 80-byte source data summary, 48-byte status/engineering summry, and 1024-byte source data histogram.

Byte			Contents
MTIS Header Block:			
1	-	1	Record id.
2			Unused.
3	-	4	Recording sequence number on EDR tape.
5	-	6	Logical sequence number on EDR file.
7			Year of century of start of data.
8			Day of year of start of data.
9	-	10	Minutes of day of start of data (10 bits).
11	-	12	Milliseconds of minute of start of data.
13			Year of century of end of data.
14			Day of year of end of data.
15	-	16	Minutes of day of end of data (10 bits).
17	-	18	Milliseconds of minute of start of data.
19	-	22	FDS time of start of data.
23	-	26	FDS time of end of data.
27	-	32	EDR tape id (ASCII).
Source Data Summary Block:			
33			Unused.
34			File number on EDR tape.
35			Fill-in type.
36			Track presence mask.

37	-	38	Average pixel value.
38	-	40	Unused.
41	-	42	Data Receipt Site Mask.
43	-	44	Minimum signal-to-noise ratio (SNR).
45	-	46	Maximum signal-to-noise ratio (SNR).
47	-	48	Unused.
49	-	50	Minimum average gain control (AGC).
51	-	52	Maximum average gain control (AGC).
53	-	54	Unused.
55	-	56	Total number of segments.
57	-	58	Number of fully synched segments.
59	-	60	Number of partially synched segments.
61	-	62	Number of segments with data quality ind = 0.
63	-	64	Number of segments with data quality ind = 1.
65	-	66	Number of segments with data quality ind = 2.
67	-	68	Number of segments with data quality ind = 3.
69	-	70	Number of segments with data quality ind = 4.
71	-	72	Number of corrected FDS counts.
73	-	74	Number of pseudonoise code (pn) errors.
75	-	76	Number of adjusted pn errors.
77	-	78	Number of unreadable source data records.
79	-	80	Number of source data logical sequence breaks.
81	-	82	Number of source data breaks.
83	-	84	Unused.
85	-	86	Number of lines.
87	-	88	Number of full lines.
89	-	90	Number of partial lines.
91	-	92	First line number.
93	-	94	Last line number.
95	-	96	Unused.
97	-	102	Picno - orbit, spacecraft, sequence in orbit (ASCII).
103	-	104	Viking reconstruction processing run number.
105	-	110	EDF disk label.
111	-	112	Unused.

Telemetry Engineering Summary Block. Each value in this block consists of two bytes (16 bits). Bit one of each word represents a data presence flag (0 = absent, 1 = present). Bit 2 is unused. Bits 3, 4, and 5 contain the data quality indicator associated with the measurement (0 = bad, 4 = good). Bit 6 is unused. The value(s) represented by the remaining bits are described below.

113	-	114	Transmitted code word. C (1 bit), gain code (1 bit), light flood (1 bit), filter (2 bits), exposure (5 bits).
115	-	116	Binary '101' (3 bits), filter number (3 bits), camera serial number (4 bits).
117	-	118	Received code word. C (1 bit), gain code (1 bit), light flood (1 bit), filter (2 bits), exposure (5 bits).
119	-	120	Unused.
121	-	122	+50 volts dc.
123	-	124	+15 volts dc.
125	-	126	+12 volts dc.
127	-	128	+5 volts dc.
129	-	130	-15 volts dc.

131	-	132	-23 volts dc.
133	-	134	Average video.
135	-	136	Power converter input 1.
137	-	138	Cathode current 1.
139	-	140	Cathode current 2.
141	-	142	Filament 1.
143	-	144	Frame sweep 1.
145	-	146	Line sweep 1.
147	-	148	Grid 3 voltage.
149	-	150	Focus 1.
151	-	152	Digital ladder.
153	-	160	Unused.

Source Data Histogram. This source data histogram contains a series of 256, 4-byte (32-bit), values giving the count of occurrences of each pixel value within the image. The first entry represents the number of pixels with value 0, followed by the number of pixels with value 1, etc., up to 255.

161	-	164	Number of pixels with value 0.
165	-	168	Number of pixels with value 1.
169	-	1196	Values 2 through 254.
1197	-	1200	Number of pixels with value 255.

c. Viking Lander File Format

Each Viking Lander image file consists of 515 or more blocks (depending on the number of label records) containing a variable number of bytes per block. The number of bytes per block is equal to the number of scan lines taken by the camera or 360, whichever is larger. The data contents of the labels are shown below.

1) Viking Lander VICAR Labels

```
                        1   1 512 382 I 1                                  C

d. Mariner 10 File Format

Each Mariner 10 image file consists of 22 blocks containing 31,944 bytes per block. Each block is composed of 33 logical records of 968 bytes each. The first logical record of the first block contains a single set of VICAR label information. The labels are followed by 700 logical records (one per image line) containing pixel data and engineering data. The data contents of the labels and engineering data are provided below.

1) Mariner 10 VICAR Labels

```
77                                    700 968 L 1                            SC
MVM73    FDS=0057910    IM-1           ERT  YR=74 DAY=036 GMT=18/21/02        C
CAMERA=B        FILTER=6(UV)           NOMINAL EXPOSURE=   45.7 MSEC          L
```

2) Mariner 10 Line Header Data

The Mariner 10 header block consists of a byte header block and a byte subheader block. Definitions for these engineering values are taken from JPL document 615-43 (Ref. A-3). Locations of parameters are given relative to the beginning of the header data, which is actually at byte 833 in the VSFEDR line record.

Bit			Contents
Header Block:			
1	-	18	Record id.
19	-	36	Record sequence number on tape.
37	-	54	Record id sequence number.
55	-	64	GMT start time milliseconds.
65	-	73	GMT start time day.
74	-	90	GMT start time seconds.
91	-	100	GMT stop time milliseconds.
101	-	109	GMT stop time day.
110	-	126	GMT stop time seconds.
127	-	144	Unused.

145	-	160	Unused.
161	-	180	FDS count (increments once per lines)
176	-	180	Das subtime (line count between das time increments).
181	-	188	Unused.
189	-	198	FDS minor frame count (cycles 1 to 700 for every FDS count increment (image)).
199	-	216	Unused.
217	-	220	Rate code of transmitted data.
221	-	234	Number of data bits in this record.
235	-	252	Number of consecutive in-sync frames.
253	-	360	Unused.

Subheader Block. The following subheader data are formatted in 18-bit words beginning with a data flag bit (0=available, 1=not available) followed by 17 bits representing the data item value right justified in the field.

361	-	576	Unused.
577	-	594	IM-1 unused; IM-3 pixel edit option flag (1 bit).
595	-	612	TV status data (16 bits).
613	-	630	TV exposure data (14 bits).
631	-	648	Filter position data (4 bits).
649	-	666	CC-5-8 coded command (13 bits).
667	-	684	CC-5-9 coded command (13 bits).
685	-	702	CC-5-10 coded command (13 bits).
703	-	720	CC-5-11 coded command (13 bits).
721	-	738	TV housekeeping word 1 (10 bits).
739	-	756	TV housekeeping word 2 (10 bits).
757	-	774	TV housekeeping word 3 (10 bits).
775	-	792	TV housekeeping word 4 (10 bits).
793	-	810	TV housekeeping word 5 (10 bits).
811	-	828	TV housekeeping word 6 (10 bits).
829	-	846	TV housekeeping word 7 (10 bits).
847	-	864	TV housekeeping word 8 (10 bits).
865	-	882	TV housekeeping word 9 (10 bits).
883	-	900	TV housekeeping word 10 (10 bits).
901	-	1088	Fill.

e. Mariner 9 File Format

Each Mariner 9 image file consists of 22 blocks containing 31,944 bytes per block. Each block is composed of 33 logical records of 968 bytes each. The first logical record of the first block contains a single set of VICAR label information. The labels are followed by 700 logical records (one per image line) containing pixel data and engineering data. The data contents of the labels and engineering data are provided below.

1) Mariner 9 VICAR Labels

77	700 968 L 1		SC

2) Mariner 9 Line Header Data

The VSFEDR header data appended to each Mariner 9 imaging line is a copy of the R7938 telemetry header and subheader data for each line of pixel values. Values for these fields are taken from JPL document 610-124 (Ref. A-4). Bit locations are given relative to the start of the header which is actually at byte 833 or bit 6657. The header consists of 20 18-bit words and the subheader is 30 18-bit words (total 50 x 18 bits = 900 bits or 113 data bytes plus 23 fill bytes) as follows:

Bit	Contents
Header Block:	
1 - 3	Spacecraft serial number.
4 - 6	Octal 3.
7 - 18	Data stream identifier.
19 - 36	Record sequence number.
37 - 54	Record id sequence number.
55 - 64	GMT start time milliseconds.
65 - 73	GMT start time day.
74 - 90	GMT start time seconds.
91 - 100	GMT stop time milliseconds.
101 - 109	GMT stop time day.
110 - 126	GMT stop time seconds.
127 - 144	Unused.
145 - 150	Unused.
151 - 175	Das time (increments once per 20 lines)
176 - 180	Das subtime (line count between das time increments).
181 - 270	Unused.
271 - 271	Decommutation mode (0=frame, 1=PN).
272 - 285	Unused.
286 - 288	PN errors allowed.
289 - 290	PN sequence status (1=no leading or trailing, 2=no leading, good trailing, 3=good leading no trailing, 4=good leading and good trailing).
291 - 303	Number of data bits in record.
304 - 306	Number of bit errors found in leading PN.
307 - 314	Half word in data block containing first element.
315 - 324	Current line count.
325 - 327	Unused.
328 - 332	Number of bits per pixel.
333 - 342	Number of pixels per line.
343 - 347	Unused.
348 - 350	Number of pixels per word.
351 - 360	Number of lines per picture.

Subheader Block. The following subheader data are formatted in 18-bit words beginning with a data flag bit (1=available, 0=not available), followed by 17 bits representing the data item value right justified in the field.

361	-	378	Picture count (6 bits).
379	-	396	Line count (10 bits).
397	-	414	Camera id (1 bit).
415	-	432	Exposure interval (4 bits).
433	-	450	Filter position (4 bits).
451	-	468	Z-008 TV beam current status (1 bit).
469	-	486	Z-015 TV calibrate status (1 bit).
487	-	504	Z-016 TV pixel average (4 bits).
505	-	522	Z-049 A shutter mode status (1 bit).
523	-	540	Z-050 filter mode status (1 bit).
541	-	558	Z-058 B shutter mode status (1 bit).
559	-	576	Z-068 shutter enable status (1 bit).
577	-	594	Z-514 DAS sequence (5 bits).
595	-	612	Z-515 A cathode current (10 bits).
613	-	630	Z-517 A grid 2 voltage (10 bits).
631	-	648	Z-517 event ladder (10 bits).
649	-	666	Z-518 A-B focus current (10 bits).
667	-	684	Z-519 plus 4 volts (10 bits).
685	-	702	Z-525 B cathode current (10 bits).
703	-	720	Z-526 B grid 2 voltage (10 bits).
721	-	738	Z-527 P/S input current (10 bits).
739	-	756	Z-528 B optics temperature (10 bits).
757	-	774	Z-529 average video (10 bits).
775	-	900	Unused.
901	-	1088	Fill.

APPENDIX B

PLANETARY MISSIONS AND DATA SETS

This appendix provides an overview of the various planetary missions, with descriptions of the imaging instruments and data products produced by each mission.

1. VOYAGER

The Voyager mission has returned over 60,000 television images of Jupiter, Saturn, their satellites, and their rings. More data are expected during the next decade as the Voyager 2 spacecraft flies past Uranus and Neptune before leaving the solar system.

The Voyager spacecraft were equipped with two mechanically shuttered cameras, each fitted with vidicon sensors and color filter wheels. Specifications for the Voyager cameras are given in Table B-1.

Most of the photographic products generated from the digital data were produced by the Mission and Test Imaging System (MTIS). A comprehensive description of the computer programs used to process the Voyager data is given in the MCCC/MTIS Voyager Program Description Document, JPL 618-792 (Ref. A-1). A final version of the Experiment Data Record (EDR) containing a minimum number of missing or defective pixels was generated for each Voyager image. The Voyager EDRs are recorded on 9-track tapes at a density of 1600 bpi. Each image comprises one file on the EDR tape, with as many as 24 files on a tape. One end-of-file marker (EOF) separates images. There are two EOFs after the last image on a tape. Each image file consists of a single header record of 1280 eight-bit bytes, followed by 800 line records consisting of 1040 bytes each. Each line record includes an MTIS header block, a source data summary, status/engineering data followed by 800 bytes of pixel data.

The major Voyager data catalogs include the Voyager picture catalog set and the Voyager SEDR catalogs. The Voyager picture catalogs contain a subset of SEDR parameters for each image as well as identification of digital image data sets and film products. There is a single major picture data file for Voyager 1 and 2 images of each planet system, and a number of sub-catalogs containing other parameters. There are three SEDR master catalogs, one for each spacecraft for Jupiter and a single tape for Saturn. These catalogs are available as stack tapes of the original delivered SEDRs or in files where all parameters have been converted to EBCDIC or ASCII character strings. Catalog file and tape identifiers are listed in Table B-2.

Copies of these catalogs in digital format can be obtained from the MIPL librarian, 818-354-4244, FTS 792-4244. Copies of printed catalogs on microfilm are available from the National Space Science Data Center (NSSDC).

Table B-1. Characteristics of Planetary Camera Systems

Mission	Focal Length (mm)	Field of View (degrees)	Field of View (Pixels (P) X Lines (L))	Bits per Pixel
Voyager				
Wide angle	200	3.0 X 3.0	800P X 800L	8
Narrow angle	1500	0.4 X 0.4	800P X 800L	8
Viking Orbiter				
Both cameras	475	1.69 X 1.54	1204P X 1056L	7
Viking Lander				
Both cameras	53.7	0.04 X 20	512P X Var.	6
Mariner 10				
Narrow angle(2)	1500	0.48 X 0.37	832P X 700L	8
Wide angle optics	62	14 X 11	832P X 700L	
Mariner 9				
Narrow angle	500	1.41 X 1.06	832P X 700L	9
Wide angle	52	13.5 X 10.5	832P X 700L	9
Mariners 6 and 7				
Narrow angle	508	1.4 X 1.1	945P X 704L	8
Wide angle	52	14 X 11	945P X 704L	8
Mariner 4				
	305	1.1 X 1.1	200P X 200L	6

2. VIKING ORBITER

In the 3-year period from June 1976 to October 1979, two Viking Orbiter spacecraft returned more than 50,000 images of the Martian surface and satellites to Earth. Although the Voyager missions have returned a greater number of images, the larger image format of the Viking cameras makes this the largest planetary data set in existence. Descriptive material on this data set is dispersed through many scientific papers, formal reports, and informal memoranda. There is no single organized catalog of data such as those that exist for Mariner 9 or for the Viking Landers.

Table B-2. Planetary Image Catalog Files

Mission and Target Body	Picture Catalogs	SEDR Catalogs
Voyager 1 Jupiter	J1PIC1	J1SDR1
Voyager 2 Jupiter	J2PIC1	J2SDR2
Voyager 1 Saturn	SPIC1	S1SDR1
Voyager 2 Saturn	SPIC1	S2SDR2
Viking Orbiter	VOPIC1	VOSED1, 2 and 3
Viking Lander	VLPIC1	VLSDR1 and 2
Mariner 10	MVMPC1	
Mariner 9	M9PIC1	SDRM71
Mariners 6&7	PICM69	
Special Catalogs		
Viking Lander Team Data Record		VLTDR
Viking Orbiter Mosaic Catalog		VOMOS1
Voyager Tape Catalog		VGRCAT
Viking Tape Catalog		VIKCAT

The Viking Orbiter imaging experiment used two identical telescopic cameras, each equipped with large format vidicon sensors and provided with a movable color filter wheel located near the focal plane. The camera characteristics are described in Table B-1. Images were initially recorded on 7-track magnetic tape recorders on the spacecraft. The data were played back to Earth one track at a time by operating the tape recorder alternately in the forward and reverse directions. Each raw data frame retrieved from the tracking station thus contains every seventh pixel arranged in either increasing or decreasing order. Image data reconstructed from these raw data frames by the MTIS form the Experiment Data Record (EDR).

The majority of Viking images were acquired as strips of contiguous and slightly overlapping images, which are most useful when assembled into mosaics. In many cases multiple strips can be assembled to form still larger mosaics, which provide a synoptic view of a regional surface and can support detailed geologic mapping.

Viking Orbiter EDRs are recorded on 9-track tape at densities of either 800 or 1600 bpi (800 was used only during the first few weeks of the mission). A maximum of 14 images are contained on one tape recorded at 1600 bpi. Images are separated by single EOFs with two EOFs following the last image on a tape. Each image file consists of an EDR header record of 1200 bytes, an SEDR record of 2000 bytes and 1056 line records, each 1600 bytes long. Records are not blocked. Pixel values are stored as 8-bit integers with a range from 0 to 255. The values represented on the EDR tape are actually two times the value received in the telemetry stream. Because of the nature of the recording and

playback system, strings of missing bits appear as vertical bars at 7-pixel intervals. Missing pixels are set to zero on the EDR tapes.

Viking Orbiter catalogs include the picture catalog, a collection of SEDR and image data product information, a set of four SEDR stack tapes, and a mosaic catalog documenting the large set of digital and hand mosaics produced by JPL during and after the mission. Table B-2 identifies tapes containing the Viking catalogs.

3. VIKING LANDER

The Viking Lander imaging data set was acquired by the two Viking Lander spacecraft on the surface of Mars. Viking Lander 1 began operation on July 10, 1976 and continued to return data until early 1983, when communications were lost. Viking Lander 2 began operation on September 3, 1976 and concluded transmission in February 1980. The camera systems utilized by the Landers are summarized in Table B-1.

A comprehensive description of this data set is provided in a three-document picture catalog. The first document, "Viking Lander Imaging Investigation: Picture Catalog of Primary Mission Experiment Data Record" (Ref. B-1) describes data from the primary mission covering the period from landing through the solar conjunction period in December 1976 when data transmission ended. The second document, "Viking Lander Imaging Investigation During Extended and Continuation Missions," in two volumes (Ref. B-2), describes the Lander 1 and 2 missions through February 1979. The final document, "Conclusion of Viking Lander Imaging Investigation" (Ref. B-3), describes the last several years of imaging activities.

The introductory material in each of the three documents includes a description of the Viking Lander cameras, their calibration, and the coordination of the Viking Lander cameras and their image data. The Viking Landers were designed to directly transmit data to Earth at low data rates as well as to relay data via the Orbiters at much higher data rates. Those documents describe the implications of these data modes for the types of data recovered from the Landers as well as the extraction of image data from the telemetry to produce the EDR data set.

The Viking Lander EDRs are recorded at 1600 bpi on 9-track tapes. A variable number of images are contained on each tape with each image separated by a single EOF and two EOFs following the last image on the tape. Image files are written in standard VICAR format with a variable number of label records followed by 512 line records. The logical record length of each label or line record is equal to the number of vertical lines in the image (variable from image to image), or 360 bytes, whichever is larger. All label information is represented in EBCDIC (Extended Binary Coded Decimal Interchange Code) format. Each pixel is stored as an 8-bit binary value ranging from 0 to 255, which represents the actual 6-bit data value from the instrument times 4.

There is also another Viking Lander digital data set called the Team Data Record (TDR). This record consists of sets of specially enhanced images

and includes mosaic data sets, color images, and other special products. Image data is stored on 9-track tapes in VICAR format recorded at 1600 bpi.

4. MARINER 10

The Mariner 10 mission was the first multiplanet mission carried out by a single spacecraft. In one flyby of Venus followed by three flybys of Mercury, Mariner 10 returned more than 12,000 images to Earth. Images of the airless body Mercury were of interest to planetary geologists, while the images of cloud-shrouded Venus were of meteorological significance.

The Mariner 10 spacecraft was equipped with two vidicon framing cameras, whose characteristics are detailed in Table B-1. The narrow-angle camera was used to image Venus and Mercury from long range and to obtain the highest resolution pictures near closest approach to the two planets. EDR and radiometrically decalibrated data exist for Mercury.

The "Atlas of Mercury" (Ref. B-4) covers the Mercury portion of the Mariner 10 mission. The Atlas includes an outline of the mission, a description of the cameras, photomosaics, maps and a set of references to the scientific photomosaic, and maps and a set of references to the scientific results. The Mercury observations of the Mariner 10 data set remain unique in that there have been no subsequent spacecraft observations of Mercury. The Venus images have recently been supplemented by the imaging type observations obtained by the Pioneer Venus Orbiter cloud photopolarimeter.

5. MARINER 9

Mariner 9 was launched on May 30, 1971. Between the time of Mars orbit insertion on November 14, 1971 and October 22, 1972, the spacecraft conducted an intensive orbital reconnaissance of the planet. The first complete geological map of Mars and the discovery of a host of hitherto unsuspected landmarks were among the spectacular results. A comprehensive description of the Mariner 9 mission and its imaging data set is provided in "Mariner Mars 1971 TV Picture Catalog," Vols. 1 and 2 (Refs. B-5 and B-6).

Mariner 9 was equipped with wide-angle and narrow-angle telescope cameras, small format selenium-sulphide vidicon sensors, and mechanical shutters. The wide-angle camera had a color filter wheel which functioned for only part of the mission. Characteristics of the cameras are given in Table B-1.

A set of Mariner 9 RDR (Reduced Data Record) images was also produced. The planetary image conversion task attempted to copy the RDR data set to high-density tape, but so many read errors were encountered that processing had to be abandoned. Substantial concern had been expressed by imaging scientists about the validity of the RDR data set, so its loss is not as tragic as it might have been.

6. MARINERS 6 AND 7

Mariner 6 and 7 spacecraft acquired 200 images of Mars at a variety of resolutions in the summer of 1969. These data are described in the "Scientific Findings from Mariner 6 and 7 Pictures, Final Report" (Ref. B-7) and "Mariner Mars 1969: A Preliminary Report" (Ref. B-8). The image tapes located by the conversion task have been computer-enhanced and actually represent a Reduced Data Record rather than an EDR. The wide-angle camera had a rotary shutter with four colored filters in the sequence red, green, blue, green, etc. The narrow-angle camera used a minus-blue haze filter. Mariner 6 and 7 images consist of 704 lines of 945 pixels. Three versions of each image were transmitted, composite analog video, digital video (every 7th pixel - 8 bits, 2 MSB truncated); and ETE (every 28th pixel). Table E-6 identifies all known Mariner 6 and 7 image tapes. All tapes are 7-track, but no other format documentation has yet been located.

7. MARINER 4

The Mariner 4 (Mars) mission acquired 22 images of Mars in 1965. By present standards the images are of very poor quality. A detailed description of the images is provided in "Mariner Mars 1964 Project: Television Experiment" (Ref. B-9) and "The Mars 1964-1965 Apparition" (Ref. B-10). Mariner 4 images contain 200 lines, each consisting of 200 six-bit pixels. The Mariner 4 digital tapes located at JPL include Master Data Records (K-xxx), MDR reacquisition tapes (MDL-xxx), TV picture tapes (KC-xxxx), and final flight pictures (RBLM-xx). Format documentation has only been found for the final flight pictures. They are stored on two identical sets of tapes: RBLM19 through RBLM22 and RBLM 23 through RBLM 26. Tape formats are described as being binary, high-density, with a physical record size of 256 bytes per block. There are 19 images contained on each tape with a single end-of-file mark after the last picture. RBLM 19 contains the true intensities of the flight pictures in regular format. Each picture consists of 16 x 172 blocks. To obtain one block from the tape, use the following FORTRAN statements:

```
DIMENSION P(16,172)
READ (L)P
```

where L is an integer constant specifying a logical unit where the tape is mounted. P(1,1) of the first block of each picture corresponds to the picture element at line 7 and column 29, and P(16,172) of the first block corresponds to the picture element at line 22, column 200. RBLM 21 contains the true intensities of the sharpened images in regular format and has the same recording characteristic as RBLM 19. Tape RBLM 20 contains the true intensities of flight pictures in rectified format. Each picture consists of twelve 16 x 193 blocks. To read an image the following FORTRAN statements can be used:

```
DIMENSION P(16,193)
READ (L) P
```

P(1,1) of the first block of each picture corresponds to the picture element at line 0 and column 11, and P(16,193) of the first block corresponds to the picture element at line 15 and column 203. RBLM 22 contains the true

intensities of the sharpened flight pictures in rectified format with the same structure as RBLM 20.

Other undocumented Mariner 4 Tape ids are listed below.

K-13,19,25,28,44,49-50,68,70,74,87,92,114-117,123-126,128,133

8. OTHER PLANETARY MISSIONS

The Pioneer 10 and 11 missions carried photopolarimeters which produced image data of the Jupiter and Saturn (Pioneer 11 only) systems. The Pioneer Venus Orbiter radar has also produced an image data set which should be incorporated into the image archive.

APPENDIX C

CONVERSION PROCESSING NOTES

This appendix provides details of the conversion activities, including a description of the setup and execution of the various processing components, a history log documenting the processing of each data set, and a brief description of the software used to produce and verify the image archive tapes.

1. PROCESSING COMPONENTS

This section provides a brief description of the major components of the image conversion task.

a. Software Modification

Modification to existing IPL image logging programs was required to produce machine-readable summary outputs documenting the status of each processing job, and to produce the VSFEDR format rather than the nominal VICAR output data set. This required only minimal rewriting of code and was performed by IPL programmers. Each logging program required about two man-weeks to modify.

b. Locating Source Data

Tapes for each mission were identified based on their tape id numbering sequences. In order to try to capture all existing data, all image tape sequences were recalled and processed, not just those known to contain valid mission data. All imaging tape sequences were recalled from the Federal Records Center and hung on tape racks in Building 231-B1. A staging area with a storage capacity of 1000 tapes was established near the IPL computer facility.

c. Processing Procedure Development

The following steps were taken to develop the processing procedure:

(1) Solicited and received approval of modified VICAR format from representatives of the imaging science community.

(2) Performed test runs of modified software to:

(a) See how much disk space each image would take.

(b) See how long each EDR would take to log to disk.

(c) Verify that the process worked properly.

(d) Assure that the printed listings provided required summary information (image identifier, VICAR label format, input tape, and file number).

(3) Performed tests to write EDR disk files out to 6250 tape to verify length of tape required for each image.

d. Blank Tape Acquisition

JPL's Information Processing Facility maintains open requisitions with several vendors to procure tapes in lots of 500 with lead times of approximately one week. The open requisitions facilitated the procurement process while keeping the paperwork to a minimum: no procurement requisition, request for quotes, or procurement vendor selection. These tapes are routinely tested for quality when received by IPC, another major benefit.

e. Record Keeping

An organized record-keeping method was developed to:

(1) Determine what was really good data to be archived and tracked.

(2) Log pertinent information for each image as processing was performed.

(3) Maintain printed listings in the order they were run for easy access (these listings were frequently used for later reference).

f. Data Processing

Job setup included the following steps:

(1) Determined the optimum order for processing EDRs.

(2) Performed an inventory to compare existing documentation with actual tapes found in storage.

(3) Created command files on the IBM computer containing correct VICAR and JCL statements to run VICAR programs created for the mission.

(4) Inserted correct input tape and output disk names to perform the required processing.

g. Output Check

Every single image that was processed by each job was checked and recorded on a processing log sheet:

(1) Jobs that terminated abnormally were identified. Failed runs were given top priority and re-run as quickly as possible, to attempt

to keep track of the data in the order that the jobs were run and to immediately identify hardware or system problems.

(2) Each output tape was scanned after it was written to double check the blocking and file count.

(3) About 20 percent of the output tapes had polaroids taken of random images to verify that the expected image was in the proper file and in the right size and format.

(4) Each output tape had a VICAR program called "VCOPY" run on it to insert the VICAR labels into a library support file.

h. Library Support File

This file was created by either the logging software or VCOPY and contained all image labels as well as tape and file number of the output image.

i. Index of VSFEDR Images

In addition to the LSF files produced by the processing and tape copy software, a separate index of picture id versus archive tape/file number was created by keypunching the processing log sheets for each mission. This task was performed at IPC and the resulting data edited and reformatted into a complete archive tape index using the MARK IV file management system on the IPL computer.

2. MISSION SPECIFIC PROCESSING NOTES

This section provides a brief description of the processing of each mission data set.

a. Voyager

Primary processing of the 60,255 Voyager images took approximately 3 months (January 16 - April 15, 1984): Logged EDRs to high-density tape; scanned output tapes to verify physical characteristics; recorded each image into logging records; made VICAR label entries in LSF; unexpected PWS data files on imaging EDRs needed special handling and slowed processing.

At completion of primary processing, about 300 images were either missing or unreadable and had to be retrieved by other means (June 18, 1984 - continuing): Wrote to USGS, Flagstaff, to get their copies, however they had only 2 images that we needed; wrote to Dr. Garry Hunt, London, to get their copies, however they had no one to do the work and it appeared that their data was in the wrong format; wrote to Univ. of Wisconsin, but got no response; put needed Voyager EDRs on the list of images to regenerate; as soon as they are regenerated, they will be logged as the rest of EDRs were (see procedure above).

b. Viking Orbiter

Primary processing of the 49,649 Viking Orbiter images took about 5-1/2 months (August 1, 1983 - January 18, 1984): Logged EDRs to high-density tape; scanned output tapes to verify physical format; recorded every image into logging records; made VICAR label entries in LSF.

At completion of primary processing, 562 images were found to contain errors or were completely missing and had to be retrieved by other means (April 1 - September 30, 1984): Requested 354 EDR tapes from USGS, Flagstaff; logged each image to high-density tape (see procedure above); about 208 images were not on the tapes received from Flagstaff; MTIS facility became operational in September 1984, however attempts to regenerate degraded images were unsuccessful. Decided to process only images that were completely missing, resulting in the regeneration of 132 images that took 2 months of processing on the MTIS computer. Fifty of these images were logged to archive tape format prior to the shutdown of the IBM computer. The remaining 82 images are stored in EDR format on VOR tapes.

c. Viking Lander

Unlike other image data sets, VL EDRs were not relogged, and the engineering telemetry parameters which were associated with the imaging records are not embedded in the archive tape format.

Primary processing of all 4731 Viking Lander images took approximately 1 month (January 23 - February 26, 1984): Computed size of each image for each job run to find out how many images would fit on each archive tape. This computation was necessary because each image was a different size. Copied each EDR image directly to high-density tape. During the write operation, the appropriate VICAR label entry was made into the LSF on disk; scanned output tapes to verify physical characteristics. Blank lines at the end of some images were discovered that resulted from a bug in the original EDR production software; recorded all images written to high-density tape into logging record books.

At completion of primary processing, 62 images (118 files) had to be rewritten due to an error in VICAR label parameters. No Viking Lander images had to be regenerated or obtained from another source.

d. Mariner 10

Primary processing of 12,817 Mariner 10 images took approximately 3 months (August 22 - November 20, 1983): Logged EDRs to disk; checked and verified all images logged to disk; recorded every single image into logging records; wrote disk version out to high-density tape, and at the same time wrote each VICAR label into separate history file on disk. A large number (7000) of small format images (IM-3 format) were encountered that had never been documented in project image catalogs and, therefore, required special handling.

At completion of primary processing, 136 images were unreadable or missing and had to be retrieved from other means (October 31 - November 13, 1983 and May 28 - June 11, 1984): Recalled MDR tapes that were used to create EDRs from storage; copied MDRs so as to not further degrade the data in processing; processed them in the same manner as the Mariner 10 EDR images were processed (see entire procedure above); only 80 of the 136 images were recovered; wrote to the University of Wisconsin for remaining images not recovered from MDRs; six months later, received only a portion of what we still needed and some that we already had, all in 9/1600 bpi; processed them in the same manner as the Mariner 10 EDR images were processed (see above), after copying them to 7-track 556 bpi (as required by the logging program).

e. Mariner 9

Primary processing of all 7767 images took approximately 2 months (May 25 - July 31, 1983): Logged EDRs to disk, checked and verified all images logged to disk, recorded every single image into logging records; wrote disk version out to high-density tape, and at the same time wrote each VICAR label into separate history file on disk; scanned all output tapes to verify physical characteristics; recorded all images written to high-density tape into logging record books.

At completion of primary processing, 62 images were unreadable and had to be retrieved from other means (September 5-11, 1983): Recalled MDR tapes that were used to create EDRs from storage; copied MDRs so as to not further degrade the data in processing; processed them in the same manner as the Mariner 9 EDR images were processed.

3. PROCESSING SOFTWARE

a. Logging Programs

These programs produce a VICAR format image from EDR format tape. Each mission required a separate program:

Voyager	VGRLOG
Viking Orbiter	VOLOG
Mariner 10	LOGMAR10
Mariner 9	LOGMAR9

These programs are documented in VICAR software user guides. VGRLOG and VOLOG have been converted for use on the MIPL VAX computers; however, they were not modified to output the special archive tape formats. Viking Lander EDRs were not relogged from the telemetry data tapes, and much of the engineering telemetry data associated is only available by processing the MDR tapes.

b. Library Support File

Mariner 9 and 10 logging programs automatically made entry in the Library Support File. Program CCOPY was used to write VICAR label to LSF for Voyager, Viking Orbiter, and Viking Lander.

c. VSFEDR Tape Verification

Program VCOPY lists VICAR labels on VSFEDR. Program TAPE2 scans a VSFEDR tape to verify:

(1) Number of files.

(2) Number of records/file.

(3) Number of bytes/record.

d. Library Support File Maintenance

A MARK IV program, SDLRUN, copies the LSF from disk to tape. Program TAPE2 creates backup of the tape and is used to scan the LSF tape and backup tape. A VICAR program, VLSFLOG, empties/initializes the disk data set in order to be ready for more input.

APPENDIX D

UNRECOVERED DATA

This appendix documents images which were not recovered during the conversion task. Attempted recovery efforts are described in Appendix C, Conversion Processing Notes. It is possible that some of the images identified in this appendix do not constitute valid imaging data, and that tapes identified in some listings may never have been written; however, the identifiers are included for completeness.

Users of archive tapes should first process the highest numbered archive tape available with the desired image on it, and, if errors are encountered, consult this listing to verify that the error was identified during the conversion effort.

Voyager images will continue to be recovered as part of the ongoing Planetary Data System recovery effort. Documentation of this work will be available through a central PDS on-line catalog.

1. VOYAGER SUSPECT OR UNRECOVERED DATA

Table D-1 identifies Voyager images and EDR tapes which were not located or successfully processed during the recovery effort. Attempts to retrieve these images from other facilities are ongoing.

2. VIKING ORBITER TAPE ERRORS AND UNRECOVERED DATA

Table D-2 identifies processing errors associated with Viking Orbiter images. Many of these images were successfully recovered from duplicate EDR tapes processed during the recovery task. This table is included for reference regarding types of errors encountered, and users should first check the archive tape catalog to determine if an image shown in this list was later successfully recovered. Errors are identified as follows for each image:

Physical errors (associated with tape I/O problems):

DC - Data check. Usually indicates physical error on EDR.

EC - Equipment check. Hardware problem with tape drive, usually recoverable by reprocessing tape.

RE - Read error. Physical error on tape.

Errors in initial production of EDR:

ML - Missing lines(s). Expected line number not found on EDR.

BR - Bad record. Unidentified record in input data.

LOS - Line out of sequence. Other than expected line number encountered on input tape.

MEOF - Missing end-of-file between image files. Caused by controller hardware problems at MTIS.

LO - Line overwritten. Duplicate line number encountered within a file.

RR - Rejected record.

MP - Missing picture identifier (picno).

3. MARINER 9 UNRECOVERED DATA

The following list identifies Mariner 9 images which could not be recovered from any source.

Picno	Das Time	
062A12	3822465	
062A15	3822675	
192B19	8478864	
214A13	9268884	
214A14	9268954	
245A??	10386679	
??????	10563334	(Possibly on MME028/178)

4. MARINER 10 UNRECOVERED DATA

The following list identifies Mariner 10 images which could not be recovered from data sets available to the conversion effort at JPL. It is possible that duplicated data sets at other institutions may be available to allow future recovery of these images, or that processed versions of these images are available.

Day	FDS Count	Day	FDS Count

		265	168831-38

Mariner 10 EDR tapes which could not be located or processed are listed below. It is not certain that all of these tapes were in fact ever produced.

ETVS152, 153, 154, 165, 198, 216, 251, 260, 283, 285, 286, 288
ETVS307, 333, 334, 335, 336, 337, 338, 339, 348, 349, 368, 373
ETVS399, 425, 433, 455, 487, 504

Table D-3 identifies images processed by the conversion task that did not correspond to existing catalogs in terms of date of acquisition versus FDS count. It is possible that good images which are improperly identified are contained on these archive tapes.

APPENDIX E

ARCHIVE TAPE INDEXES

This appendix presents a set of reports correlating picture identifier with archive (VSFEDR) tape and file number for all missions. The Mariner 9 and Viking Lander indexes contain one line for each image, whereas all other mission listings have been compressed, so that sequences of regularly incrementing picture identifiers and archive tape/file numbers are represented on one line. Picture identifiers and their sequencing are described below for each mission as well as any peculiarities in the sequencing of images and tape ids for that mission.

TABLE E-1

VOYAGER ARCHIVE INDEX

The Voyager FDS count is used to identify images. Images for both Voyager spacecraft and both planetary encounters are ordered by FDS count. The listing gives the first and last FDS counts for a sequence in the format xxxxx.yy-zz, where xxxxx is the Mod 60 counter (which increments every 48 minutes), and yy and zz are the starting and ending Mod 16 counts (which increments every 48 seconds) for the first and last image in the interval. The tape id and file numbers for the images are represented as ttt/uu-vv, where ttt is the reel number of the VGE tape (VGEttt), and uu and vv are the beginning and ending file locations of the images.

Voyager images are not necessarily taken in sequences of monotonically incrementing FDS counts. Sequences where the FDS count increments by 2, 4, 6, and 8 counts between images are common. These sequences are condensed as shown below:

14651.04-10 223/040-043

This entry indicates that image 14651.04 is on tape VGE223, file 040, image 14651.06 is on VGE223/041, 14651.08 is on VGE223/042, and 14651.10 is on VGE223/043. The FDS count increment for a group of images is computed as last count minus first count divided by last file minus first file (in the example 10 - 4 / 43 - 40 = 2. This grouping was required to reduce the size of the listing to manageable proportions (from 240 pages to 80 pages).

TABLE E-2

VIKING ORBITER ARCHIVE INDEX

Viking Orbit images are identified by PICNO, a composite of orbit number, spacecraft id (represented by a single letter), and picture count within orbit. In general, the spacecraft id letter "A" indicates Viking Orbiter 1 images, while the letter "B" represents Viking Orbiter 2 images. The spacecraft id letter was also used to differentiate between images taken during pre-orbit mission phases ("C" and "D" were used to represent spacecraft 1 and 2 in these sequences), optical navigation images ("E" and "F" representing spacecraft 1 and 2), images from the survey mission ("S" was used for images from spacecraft 1). The letter "X" was used in some cases when the count of images within an orbit exceeded 99.

The index listing presents images ordered by spacecraft letter designation, and by ascending PICNO within spacecraft. Images are grouped into sequences of monotonically incrementing PICNO and archive tape/file number. Thus, the entry

003A01-08 008/17-24

indicates that image 003A01 is on file 17 of archive tape VOE008, 003A02 is on file 18, and so on to 003A08, which is on file 24.

Users will have to perform a simple calculation to locate an image embedded in one of these sequences. This compression reduces the size of the listing from 200 pages to 20 pages.

TABLE E-3

VIKING LANDER ARCHIVE INDEX

Viking Lander images are identified in the index by spacecraft number (Viking Lander 1 or 2), camera number (1 or 2) and frame count, a counter composed of a regularly incrementing letter (A, B, etc.), followed by a number which increments from 0 to 255 within each frame count letter. The index is ordered by spacecraft and by frame count within spacecraft.

Repeated entries for the same camera event are due to the taking of triplets, most commonly color triplets (composed of a blue, green, and red diode sequence of images) and sometimes an infrared sequence (consisting of an IR3, IR2, and IR1 diode sequence).

In general, users will want all three files of a triplet sequence for processing.

TABLE E-4

MARINER 10 ARCHIVE INDEX

Images are uniquely identified by FDS COUNT and GMT day. This method was necessary because the FDS clock reset to zero several times during the mission, causing images with identical FDS COUNTs to be taken for different image sequences. Images are grouped similar to the method used for the Viking Orbiter listing.

FDSCOUNT	DAY	MVE ID	FDSCOUNT	DAY	MVE ID	FDSCOUNT	DAY	MVE ID	FDSCOUNT	DAY	MVE ID	FDSCOUNT	DAY	MVE ID

TABLE E-5

MARINER 9 ARCHIVE INDEX

Images are identified by DAS TIME, a spacecraft clock count that increments every 1.2 seconds. Alternate A and B camera images could be taken on 35-count intervals. There is a 5-count (or less) discrepancy in the association of DAS TIMES with images depending whether one uses the telemetry DAS TIME or the DAS TIME associated with the image shuttering. This discrepancy is due to the telemetry DAS COUNT being attached to an image after it was read off the vidicon and onto the spacecraft tape recorder. The DAS TIME representing the actual shutter time is used in this listing. It was fairly common for playback sequences to wrap around the spacecraft tape recorder so that the first one or two images were transmitted to Earth twice. This is the reason why certain images are found twice on the same archive tape.

TABLE E-6

MARINER 6 AND 7 SOURCE TAPE INDEX

Table E-6 provides an index of all source tapes containing image data from the Mariner 6 and 7 missions. The conversion staff was not able to locate any documentation describing the formats of data stored on these tapes. The listing is ordered by picture identifier, a composite of the spacecraft number (6 or 7), encounter phase (F = far encounter, N = near encounter), and a sequential picture count within the encounter phase. The tape and file number of each source tape is listed, along with a field representing the processed version type for the image on this tape. In some cases the version type field identifies the data taking mode at the spacecraft (CAV, DV, and ETE) as described in Appendix B. In other cases it appears to represent a processed version identifier (MAXD for maximum discriminability, for example). The listing was generated from the "PICM69" picture catalog tape.

IMAGING DATA ON MAGNETIC TAPE

75-083A-01W

THIS DATA SET CATALOG CONSISTS OF 179 MAGNETIC TAPES. THE TAPES ARE 9-TRACK, 6250 BPI, BINARY AND ARE MULTI-FILED. THE TAPES WERE CREATED ON AN IBM 370 COMPUTER. THE D AND C NUMBERS ALONG WITH THE NUMBER OF FILES AND THE ID ARE ON THE FOLLOWING PAGES:
