APOLLO 15 & 16 JSC RAW DOPPLER FREQUENCY DATA
71-063D-03A
72-031D-03A

This dataset is from the Apollo 15 and 16 subsatellites, which were used to measure the lunar gravitational field based on their dynamical motions. A stable frequency of 2115 MHz was transmitted to the subsatellite which multiplied the received signal by 240/221 and transponded it back to Earth. At the Earth receiver, the initial transmitted frequency was multiplied by 240/221 and subtracted, and the resulting cycle count differences were accumulated for data reduction. The resolution is 0.01 Hz, or 0.6 mm/s.

The data were originally created on an IBM 7094 and were stored on odd parity non-FORTRAN, 800 bpi density tapes. These have been migrated to 9 track tapes by NSSDC. The conversion to 9 track tape has resulted in the addition of 2 bits per byte, making the original 6 bits into 8 bits. This must be corrected to put the data back in its original format by removing these 2 bits. The bits are zeroes which are in the 2 most significant bit position in each byte (*i.e.* a byte which was originally 101001 on the 7 track tape is 00101001 on the 9 track tape). After removing the zeroes, the bits should be mapped end to end, most significant bit on the left to match the bitwise format shown on the next page. These tapes contain high speed data only (10 observations per second). Each tape has 89 word records with 10 observation frames per record. Each frame consists of 320 bits (after the 2 extra bits have been removed from each byte) with each successive frame starting 321 bits from the start of the previous frame. The format of each observation frame is the high speed (fixed station) USB format shown on the next page. One seconds worth of data therefore consists of 10 observations at 320 bits/observation or 3200 bits. The total space available is 89 words, 36 bits/word or 3204 bits per record.

The next page shows the bitwise format of the first observation frame of a given data record.

Notes:

1. Words No. 1 and 2 are the CCATS Label and Time Word, respectively, which are inserted by ALCS by the receiving station (ALCS). These words are included in each observation.

2. Words No. 3-9 contain the 240 bits of high speed tracking data from remote sites. These data are in high speed (fixed station) USB format. Bits 311-320 (Word No. 9) are filler zeros added by ALCS.

3. The next observation begins immediately after bit 320 (word 9).

29. A Dual USB site has the capability to support two spacecraft when both vehicles are within the beam width of the single antenna. There are two USB receiver/exciter/ranging (RER) systems at a Dual site. The Tracking Data Processor (TDP), which formats the tracking data, has three modes of operation. In the "Dual" mode of operation the TDP accepts frequency, range, range rate and indicator data from both USB (RER) systems. When operating in one of the other two modes, the TDP accepts data from either USB (RER) system one or two. Independent of the mode of operation, the angle data will always be for the prime vehicle as specified in the NOD. When operating in the "Dual" mode, the TDP will time multiplex the data; i.e., one frame of data from USB (RER) system one, one frame from USB (RER) system two, etc. The effective data rate is therefore one-half of the selected rate. The following bits within the Fixed USB High Speed Format are directly associated with each USB (RER) system and may change for each frame of data output by the TDP:

Bit 85-Doppler Count
Bit 86-Doppler Mode

April 23, 1974

In order to calculate the time spans on the tapes in these data sets, the following must be done:

1) The 'Time of Year', found in bits 26-36 of the 3rd word and bits 1-18 of the 4th word of each logical record, must be broken down into bits. Example:

WORD 3	WORD 4
624216411344	053342235722
11001010001000111010000101011100100	00010101101110000101001111011111010110

2) Change these 29 bits from binary to octal:

$$01011100100000101011011100010 = 134405334_8$$

3) Convert this octal number to decimal:

$$134405334_8 = 194008802_{10}$$

4) This decimal number is then divided by 864,000 (number of tenths of seconds

in a day):

$$864000 \overline{)19400880} \quad \begin{array}{r} 224.55 \\ 2.0 \end{array} =$$

DAY 224 HR 13

Even though the Julian day can be derived, there is nothing on the tapes to indicate the year of the date.

year can be handled from tape #.
